

Object Recognition with Interest Operators

ECE P 596
Autumn 2019

Linda Shapiro

Object Recognition with Interest Operators

- Object recognition started with line segments.
 - Roberts recognized objects from line segments and junctions.
 - This led to systems that extracted linear features.
 - CAD-model-based vision works well for industrial.
- An “appearance-based approach” was first developed for face recognition and later generalized up to a point.
- The interest operators have led to a new kind of recognition by “parts” that can handle a variety of objects that were previously difficult or impossible.

Object Class Recognition by Unsupervised Scale-Invariant Learning

R. Fergus, P. Perona, and A. Zisserman

CVPR 2003

won the best student paper award

CVPR 2013

won the best 10-year award

Goal:

- Enable Computers to Recognize Different Categories of Objects in Images.

Motorbikes

Airplanes

Faces

Cars (Side)

Cars (Rear)

Spotted Cats

Background

Approach

- An object is a constellation of parts (from Burl, Weber and Perona, 1998).
- The parts are detected by an **interest operator** (Kadir's).
- The parts can be recognized by appearance.
- Objects may vary greatly in scale.
- The constellation of parts for a given object is **learned** from training images

Components

- Model
 - Generative Probabilistic Model including Location, Scale, and Appearance of Parts
- Learning
 - Estimate Parameters Via EM Algorithm
- Recognition
 - Evaluate Image Using Model and Threshold

Model: Constellation Of Parts

Fischler & Elschlager, 1973

Yuille, 91

Brunelli & Poggio, 93

Lades, v.d. Malsburg et al. 93

Cootes, Lanitis, Taylor et al. 95

Amit & Geman, 95, 99

Perona et al. 95, 96, 98, 00

Parts Selected by Interest Operator

 $f_{0.5}$

121 dimensions was too big, so they used PCA to reduce to 10-15.

Learning a Model

- An object class is represented by a generative model with P parts and a set of parameters θ .
- Once the model has been learned, a decision procedure must determine if a new image contains an instance of the object class or not.
- Suppose the new image has N interesting features with locations X , scales S and appearances A .

Probabilistic Model

$$p(\mathbf{X}, \mathbf{S}, \mathbf{A} | \theta) = \sum_{\mathbf{h} \in H} p(\mathbf{X}, \mathbf{S}, \mathbf{A}, \mathbf{h} | \theta) =$$
$$\sum_{\mathbf{h} \in H} \underbrace{p(\mathbf{A} | \mathbf{X}, \mathbf{S}, \mathbf{h}, \theta)}_{\text{Appearance}} \underbrace{p(\mathbf{X} | \mathbf{S}, \mathbf{h}, \theta)}_{\text{Shape}} \underbrace{p(\mathbf{S} | \mathbf{h}, \theta)}_{\text{Rel. Scale}} \underbrace{p(\mathbf{h} | \theta)}_{\text{Other}}$$

- \mathbf{X} is a description of the **shape** of the object (in terms of locations of parts)
- \mathbf{S} is a description of the **scale** of the object
- \mathbf{A} is a description of the **appearance** of the object
- θ is the (maximum likelihood value of) the **parameters** of the object
- \mathbf{h} is a hypothesis: a set of parts in the image that might be the parts of the object
- H is the set of all possible hypotheses for that object in that image.
- For N features in the image and P parts in the object, its size is $O(N^P)$

Appearance

The appearance (A) of each part p has a Gaussian density with mean c_p and covariance V_p .

Background model has mean c_{bg} and covariance V_{bg} .

Gaussian Part Appearance PDF

Object

Gaussian Appearance PDF

Background

Shape as Location

Object shape is represented by a joint Gaussian density of the locations (X) of features within a hypothesis transformed into a scale-invariant space.

Gaussian Shape PDF

Object

Uniform Shape PDF

Background

Scale

The relative scale of each part is modeled by a Gaussian density with mean t_p and covariance U_p .

Prob. of detection

Occlusion and Part Statistics

This was very complicated and turned out to not work well and not be necessary, in both Fergus's work and other subsequent works.

Learning

- Train Model Parameters Using EM:

- Optimize Parameters
- Optimize Assignments
- Repeat Until Convergence

$$\theta = \{\underbrace{\mu, \Sigma, c, V}_{\text{location}}, \underbrace{M, p(d|\theta)}_{\text{appearance}}, \underbrace{t, U}_{\text{scale}}, \underbrace{p(d|\theta)}_{\text{occlusion}}\}$$

$$\hat{\theta}_{ML} = \arg \max_{\theta} p(\mathbf{X}, \mathbf{S}, \mathbf{A} | \theta)$$

Learns which small regions are important to being a face.

Recognition

Make this likelihood ratio:

$$\begin{aligned} R &= \frac{p(\text{Object}|\mathbf{X}, \mathbf{S}, \mathbf{A})}{p(\text{No object}|\mathbf{X}, \mathbf{S}, \mathbf{A})} \\ &= \frac{p(\mathbf{X}, \mathbf{S}, \mathbf{A}|\text{Object}) p(\text{Object})}{p(\mathbf{X}, \mathbf{S}, \mathbf{A}|\text{No object}) p(\text{No object})} \\ &\approx \frac{p(\mathbf{X}, \mathbf{S}, \mathbf{A}|\theta) p(\text{Object})}{p(\mathbf{X}, \mathbf{S}, \mathbf{A}|\theta_{bg}) p(\text{No object})} \end{aligned}$$

Is it the Object or not?

greater than a threshold.

RESULTS

- Initially tested on the Caltech-4 data set
 - motorbikes
 - faces
 - airplanes
 - cars
- Now there is a much bigger data set: the Caltech-101
- And many more
