

Homework 4

Anup Rao

Due: October 30, 2020

Read the fine print¹. An algorithm is said to run in polynomial time if it runs in time $O(n^d)$ for some constant d on inputs of size n . Each problem is worth 10 points:

1. Show an execution of Kruskal's algorithm to compute the minimum spanning tree of the following graph. Show the state of the connected components (union find) data structure at each step:

2. You are given a graph G with n vertices and m edges, and a minimum spanning tree T of the graph. Suppose one of the edge weights $w(e)$ of the graph is updated. Give an algorithm that runs in time $O(m)$ to test if T still remains the minimum spanning tree of the graph. You may assume that all edge weights are distinct both before and after the update. HINT: If $e \in T$, consider the cut obtained by deleting e from T . If $e \notin T$, consider the cycle formed by adding e to T .
3. Here's a problem that occurs in automatic program analysis. For a set of variables x_1, \dots, x_n , you are given some equality constraints, of the form $x_i = x_j$ and some disequality constraints, of the form $x_i \neq x_j$. Is it possible to satisfy all of them? For instance, the constraints $x_1 = x_2, x_2 = x_3, x_3 = x_4, x_1 \neq x_4$ cannot be satisfied. Give an efficient algorithm that takes m constraints over n variables, and outputs whether they can be satisfied or not in time $O(m \log n)$. HINT: Construct a graph from these constraints, and try to check whether or not some vertices are connected.

¹In solving the problem sets, you are allowed to collaborate with fellow students taking the class, but **each submission can have at most one author**. If you do collaborate in any way, you must acknowledge, for each problem, the people you worked with on that problem. The problems have been carefully chosen for their pedagogical value, and hence might be similar to those given in past offerings of this course at UW, or similar to other courses at other schools. Using any pre-existing solutions from these sources, for from the web, constitutes a violation of the academic integrity you are expected to exemplify, and is strictly prohibited. Most of the problems only require one or two key ideas for their solution. It will help you a lot to spell out these main ideas so that you can get most of the credit for a problem even if you err on the finer details. Please justify all answers. Some other guidelines for writing good solutions are here: <http://www.cs.washington.edu/education/courses/cse421/08wi/guidelines.pdf>.
