- Software architecture vs. software design

SW Design: Purposes, Concepts, and Misfits

Purposes, Concepts, Misfits, and a Redesign of Git

Santiago Perez De Rosso Daniel Jackson

Computer Science and Artificial Intelligence Lab
Massachusetts Institute of Technology
Cambridge, MA, USA
{sperezde, dnj}@csail.mit.edu

Concept and motivating purpose

“A **concept** is something you need to understand in order to use an application (and also something a developer needs to understand to work effectively with its code) and is invented to solve a particular problem, which is called the **motivating purpose**.”

Use cases are a good starting point
for identifying concepts for motivating purposes.

Operational principle and misfit

“A concept is defined by an **operational principle**, which is a scenario that illustrates how the concept fulfills its motivating purpose.”

Operational principle and misfit

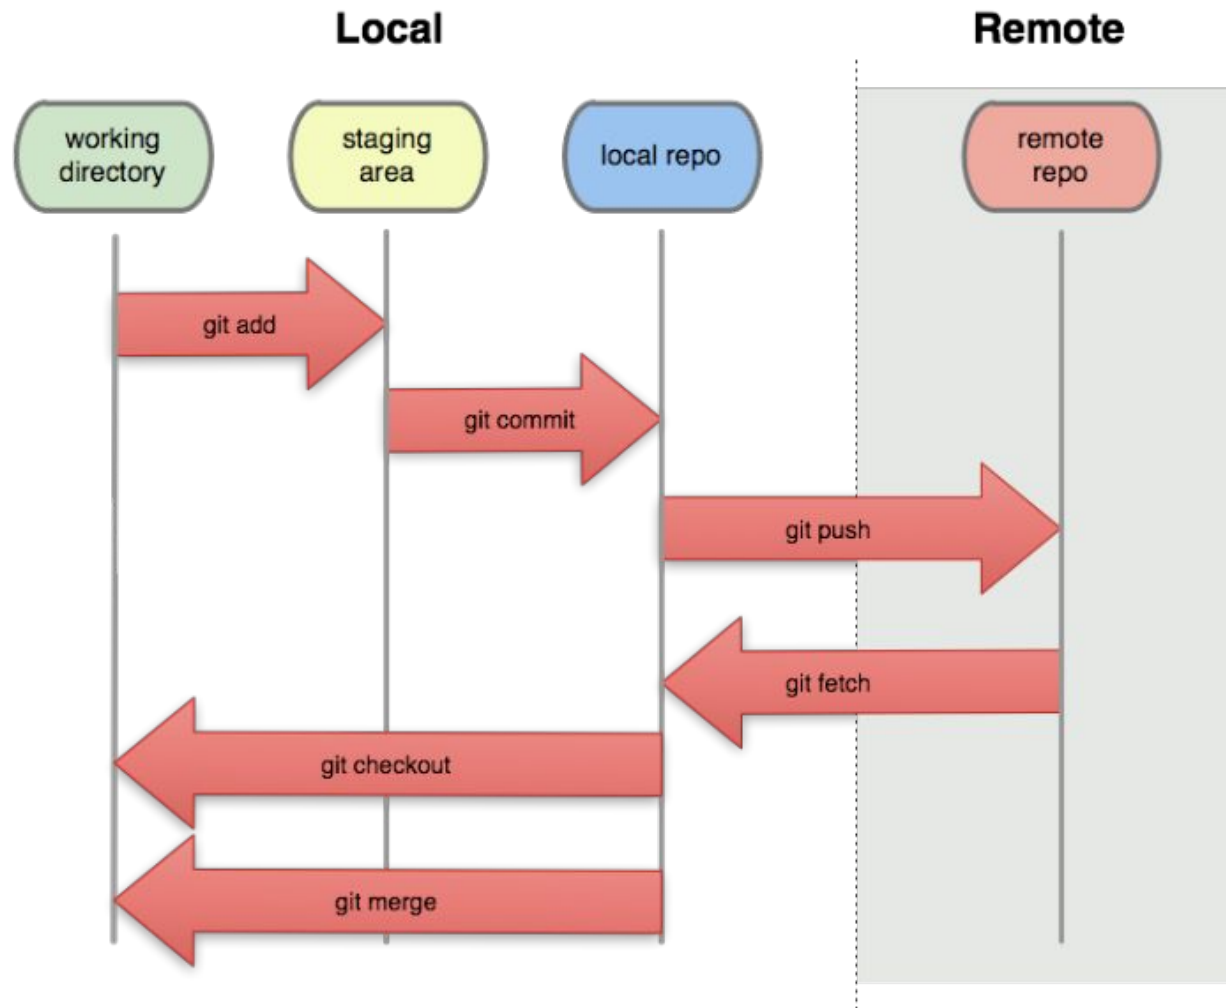

“A concept is defined by an **operational principle**, which is a scenario that illustrates how the concept fulfills its motivating purpose.”

“A concept may not be entirely fit for purpose. In that case, one or more **operational misfits** are used to explain why. The operational misfit usually does not contradict the operational principle, but presents a different scenario in which the prescribed behavior does not meet a desired goal.”

Git: another example for concepts and purposes

What concepts can we identify in Git
(and version control systems in general)?

Properties of a good software design

Motivation

Each concept should be motivated by at least one purpose.

Coherence

Each concept should be motivated by at most one purpose.

Fulfillment

Each purpose should motivate at least one concept.

Non-division

Each purpose should motivate at most one concept.

Decoupling

Concepts should not interfere with one another's fulfillment of purpose.

Properties of a good software design

Motivation

Each concept should be motivated by at least one purpose.

Coherence

Each concept should be motivated by at most one purpose.

Fulfillment

Each purpose should motivate at least one concept.

Non-division

Each purpose should motivate at most one concept.

Decoupling

Concepts should not interfere with one another's fulfillment of purpose.

Properties of a good software design

Motivation

Each concept should be motivated by at least one purpose.

Coherence

Fulfillment

Each purpose should motivate at least one concept.

Non-division

Each purpose should motivate at most one concept.

Decoupling

Concepts should not interfere with one another's fulfillment of purpose.

Properties of a good software design

Motivation

Each concept should be motivated by at least one purpose.

Coherence

Each concept should be motivated by at most one purpose.

Fulfillment

Each purpose should motivate at least one concept.

Non-division

Each purpose should motivate at most one concept.

Decoupling

Concepts should not interfere with one another's fulfillment of purpose.

Software architecture vs. software design

Why software architecture and design?

“There are two ways of constructing a software design:

one way is to make it so simple that there are obviously no deficiencies;

the other is to make it so complicated that there are no obvious deficiencies.” [Tony Hoare]

Goals: separation of concerns and modularity.

Architecture vs. design

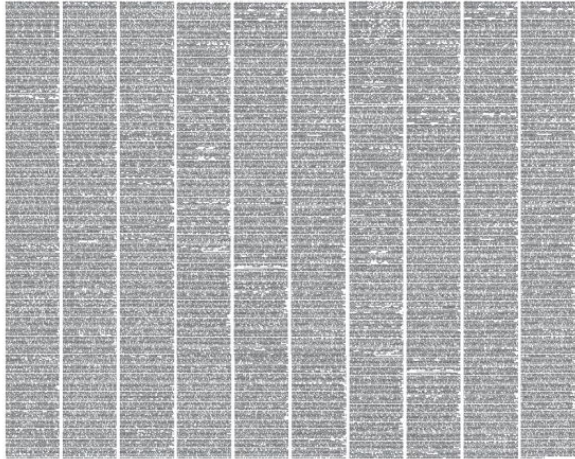

Abstraction

Building an abstract representation of reality

- Ignoring (insignificant) details.
- Focusing on the most important properties.
- Level of abstraction depends on viewpoint and purpose:
 - Communication
 - Component interfaces
 - Verification and validation

Different levels of abstraction

Source code

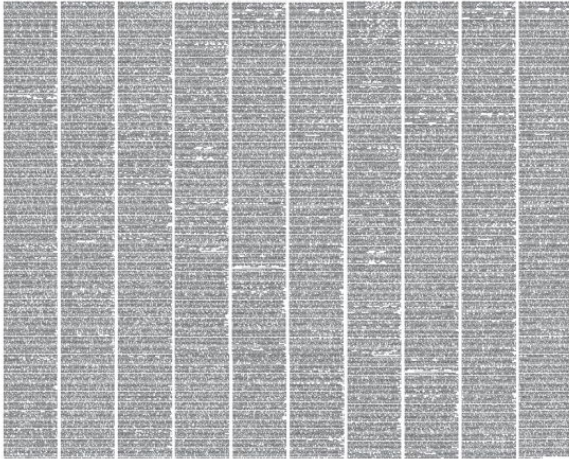

Example: Linux Kernel

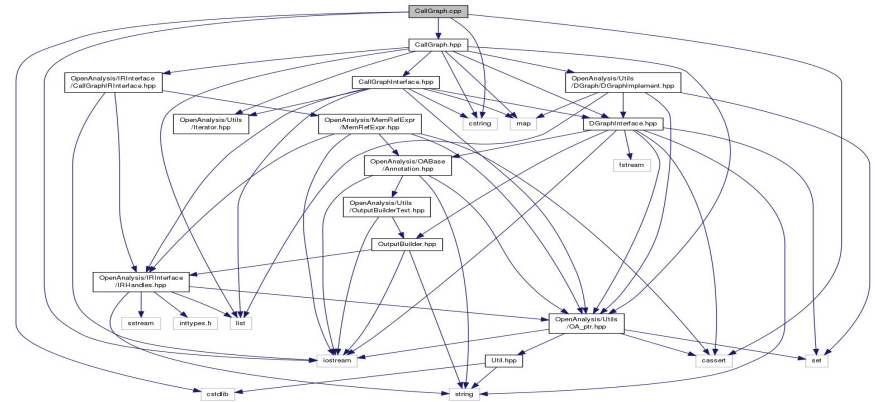

- 16 million Lines of Code!
- What does the code do?
- Are there dependencies?
- Are there different components?

Different levels of abstraction

Source code

Call graph

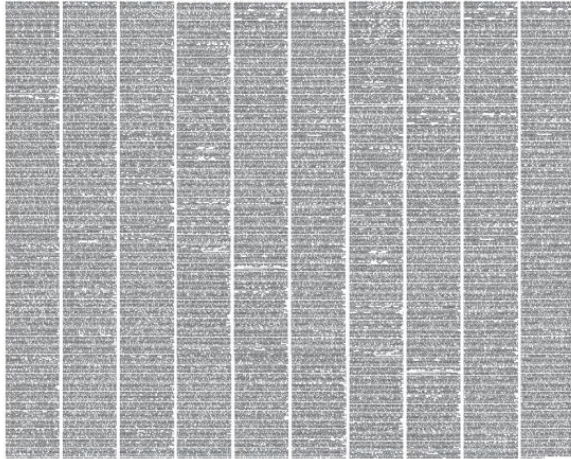

Example: Linux Kernel

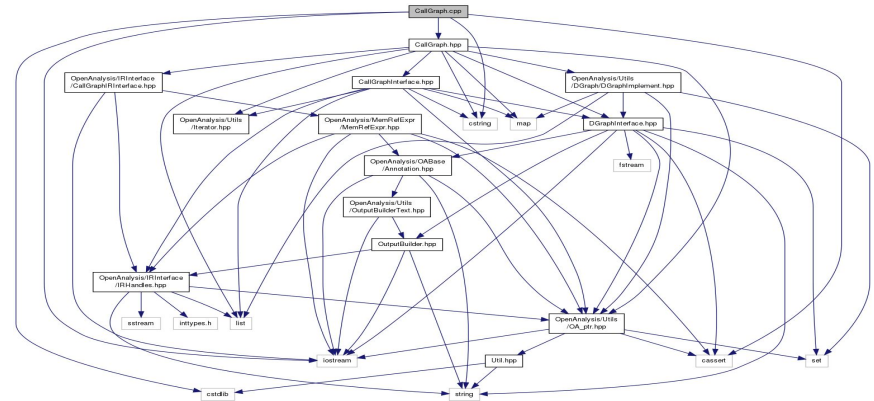

- 16 million Lines of Code!
- What does the code do?
- **Are there dependencies?**
- Are there different components?

Different levels of abstraction

Source code

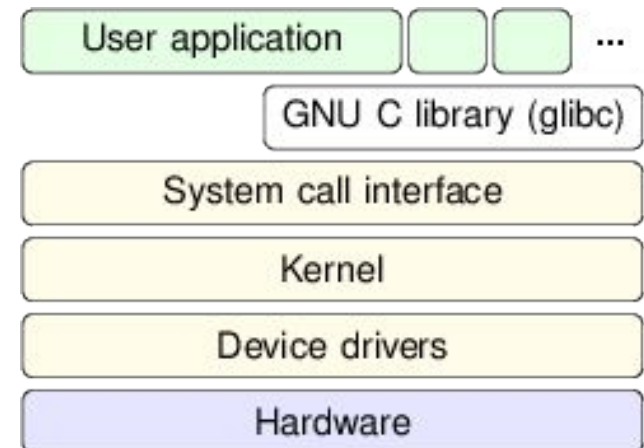

Call graph

Layer diagram

Example: Linux Kernel

- 16 million Lines of Code!
- What does the code do?
- Are there dependencies?
- **Are there different components?**

Architecture vs. design

What's the difference?

Architecture vs. design

Architecture (what is developed?)

- High-level view of the overall system:
 - What components do exist?
 - What are the protocols between components?
 - What type of storage etc.?

Design (how are the components developed?)

- Considers individual components:
 - Data representation
 - Interfaces, Class hierarchy
 - ...

Architecture vs. design

Architecture

[Gates Center Architecture, LMN]

Design

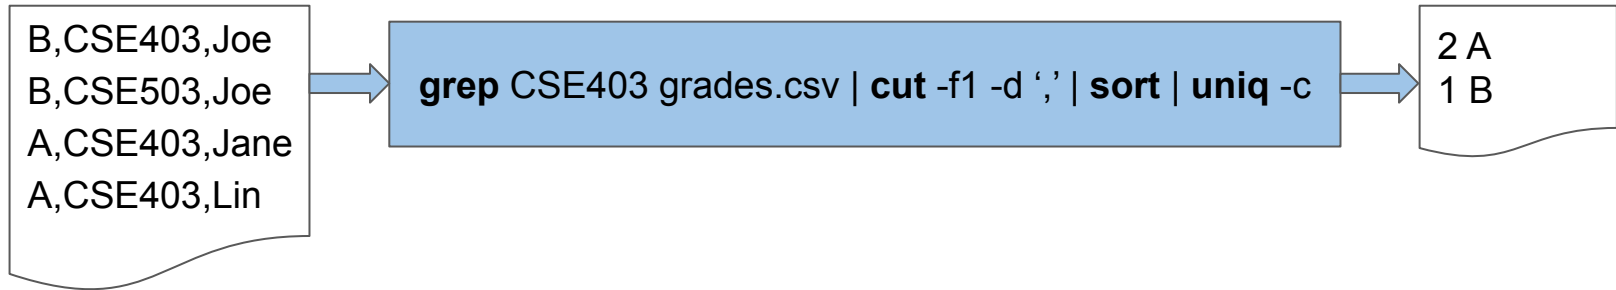

[Office design, New York Times]

A first example

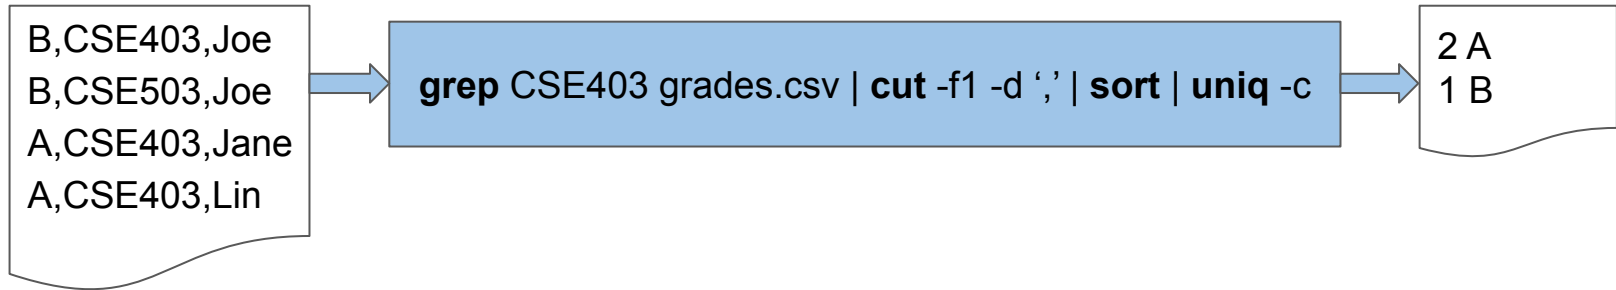

Goal: group and count CSE403 letter grades.

Pipe and filter

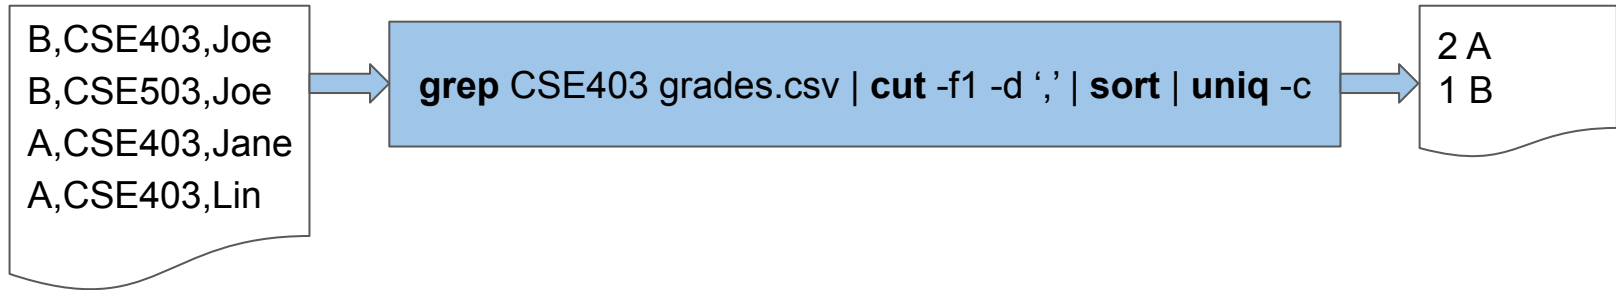

Pipe and filter

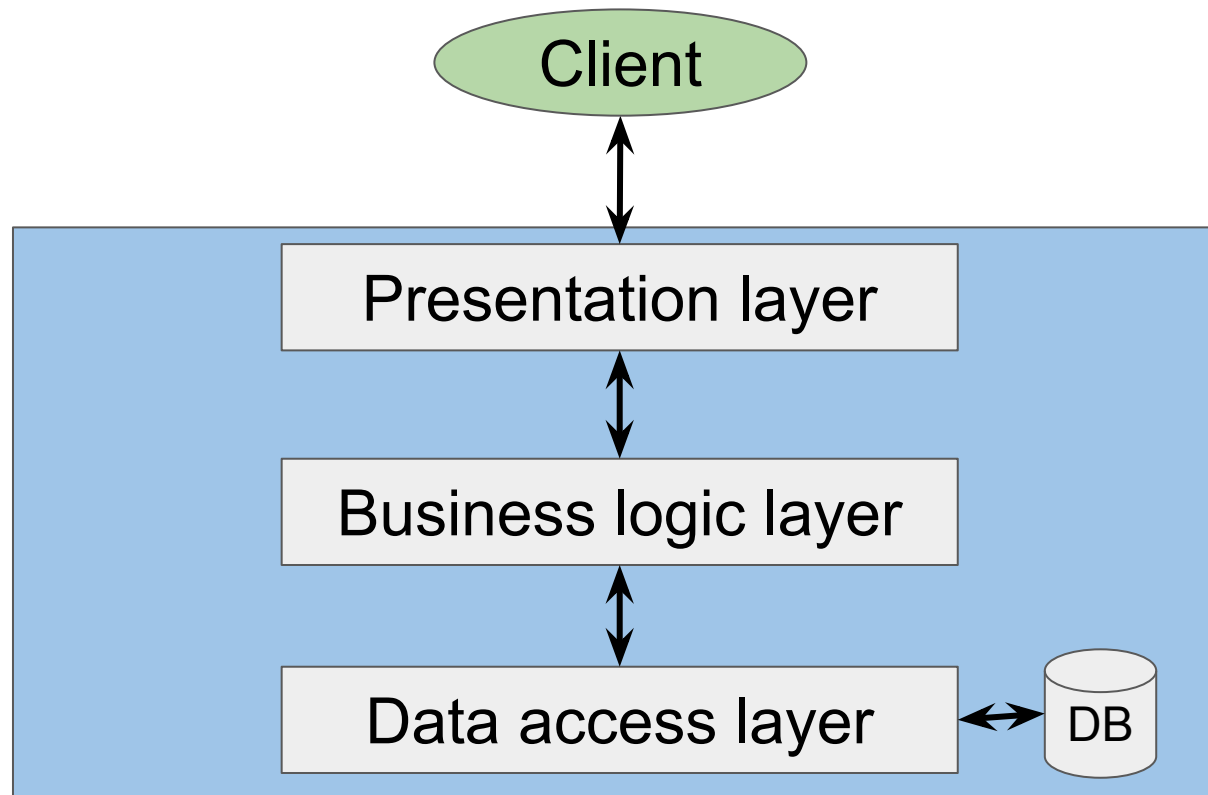

Pipe and filter is an architecture (not a design) pattern, why?

Software architecture: Pipe and Filter

The pipe-and-filter architecture doesn't specify the design or implementation details of the individual components (filters)!

Software architecture: Client-server / n-tier

Simplifies reusability, exchangeability, and distribution.

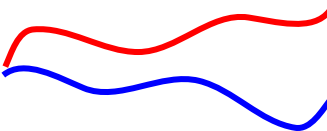

Software architecture: Model View Controller (MVC)

Separates data representation (Model),
visualization (View), and client interaction (Controller)

Model View Controller: example

Simple weather station

Current	30 day history
25° F	
-4° C	max: 5° C min: -7° C

Model View Controller: example

Simple weather station

Model View Controller: example

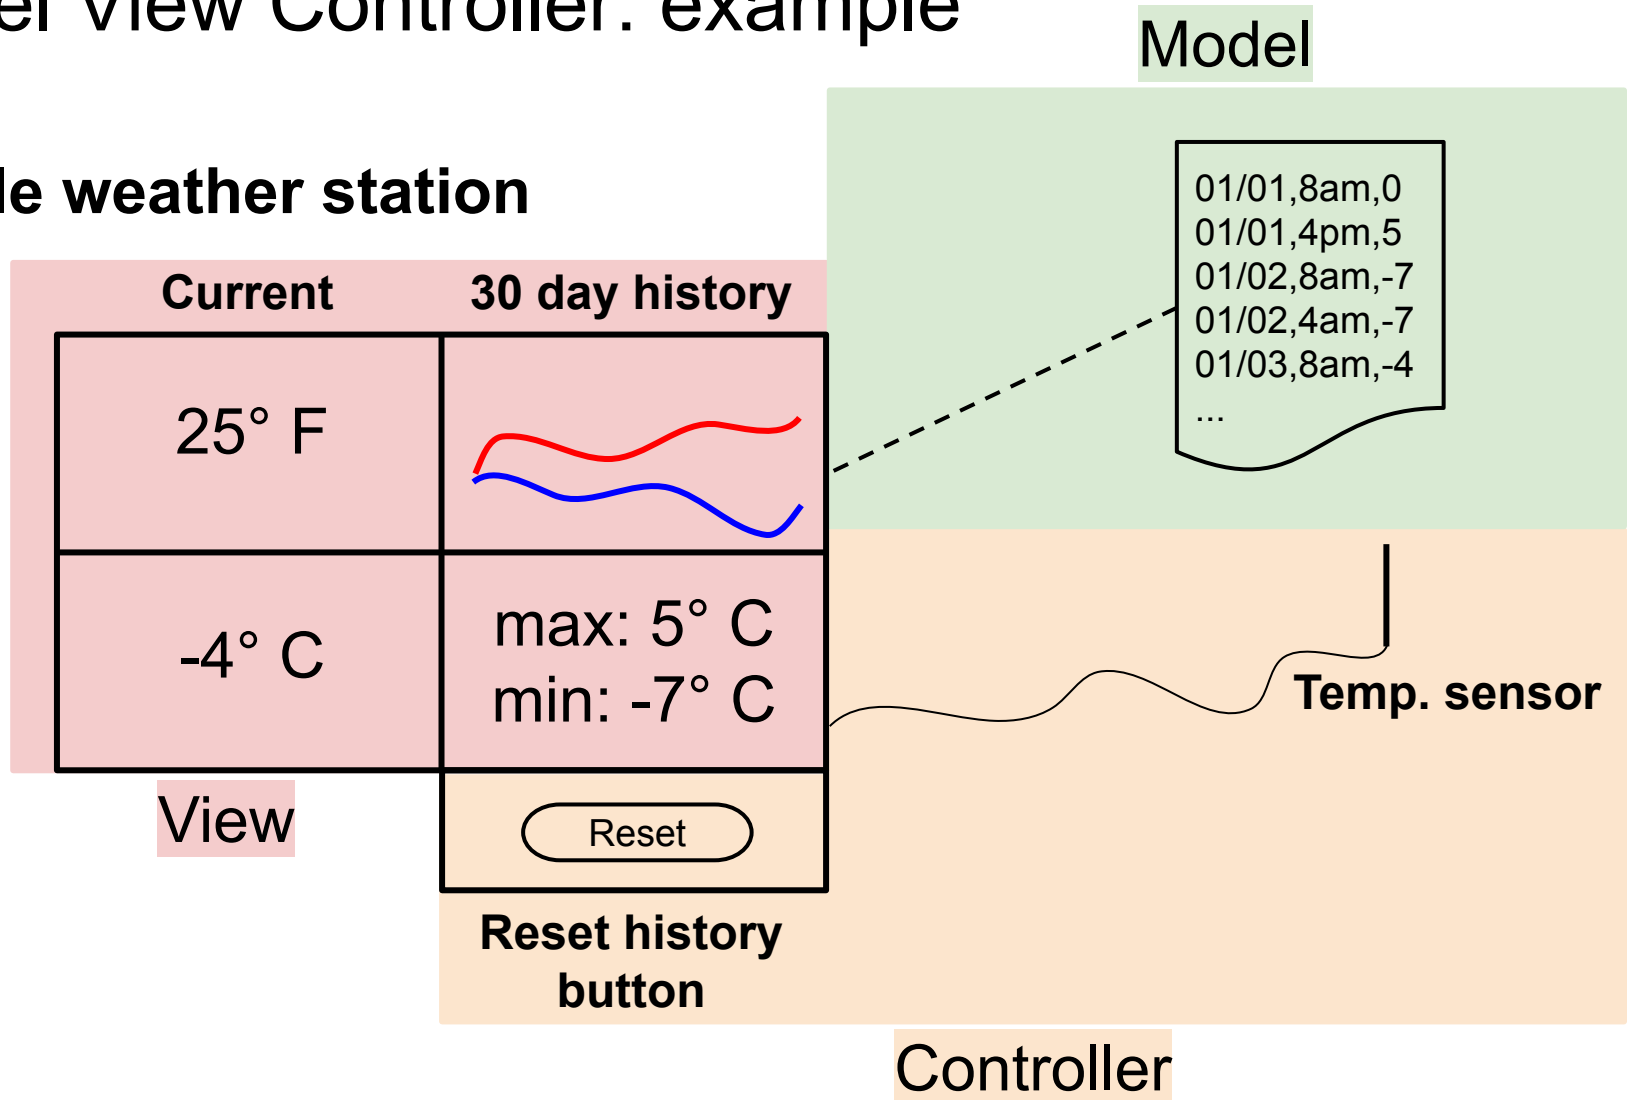

Simple weather station

What are the **Model**, **View**, and **Controller** components?

Model View Controller: example

Simple weather station

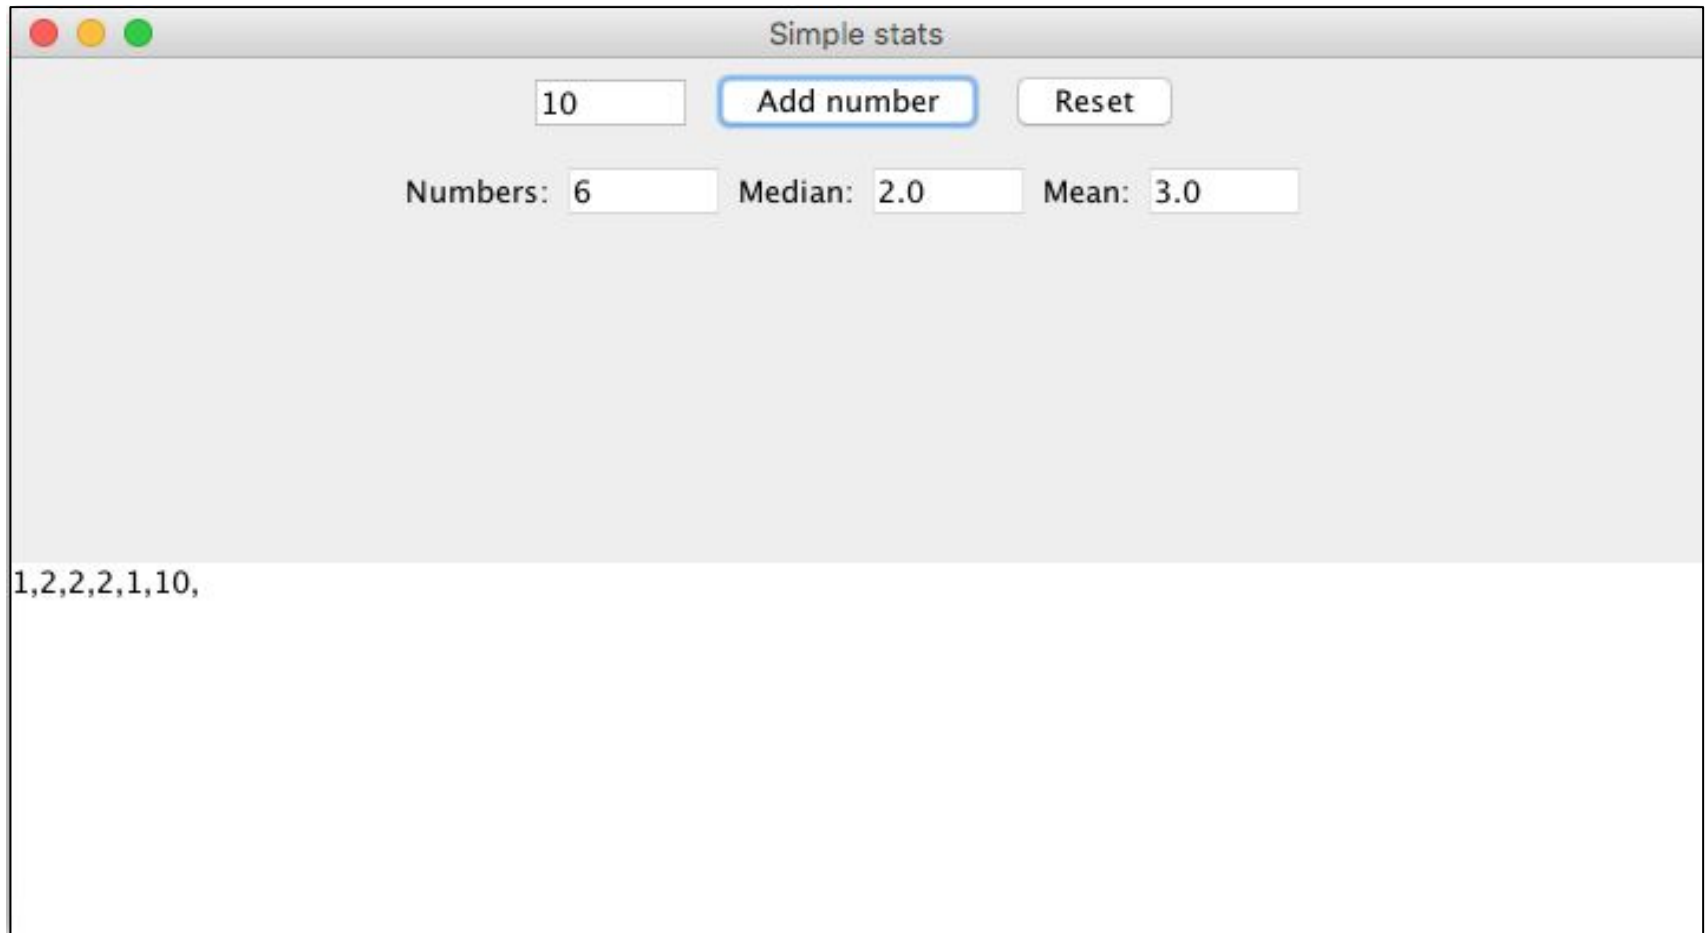

Software architecture: Model View Controller (MVC)

Separates data representation (Model),
visualization (View), and client interaction (Controller)

MVC: another example

The screenshot shows a window titled "Simple stats" with a light gray background. At the top, there are three colored window control buttons (red, yellow, green). Below them, there is a text input field containing the number "10", followed by a button labeled "Add number" (which is highlighted with a blue border), and a button labeled "Reset". Below these controls, there are three labels with corresponding text boxes: "Numbers: 6", "Median: 2.0", and "Mean: 3.0". At the bottom of the window, there is a white area containing the text "1,2,2,2,1,10,".

<https://bitbucket.org/rjust/basic-stats>

MVC vs. MVP vs. MVVM

Current	30 day history
25° F	
-4° C	max: 5° C min: -7° C

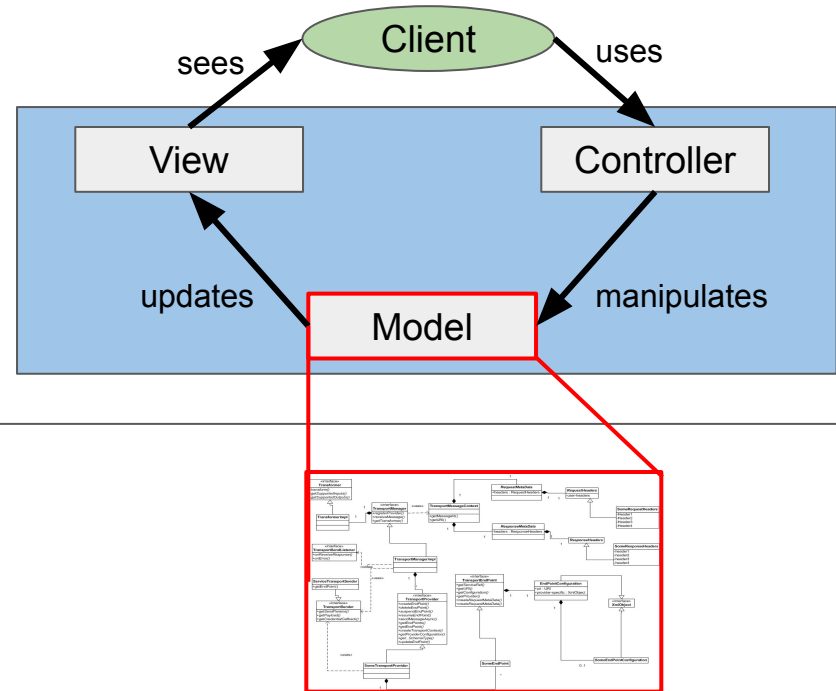

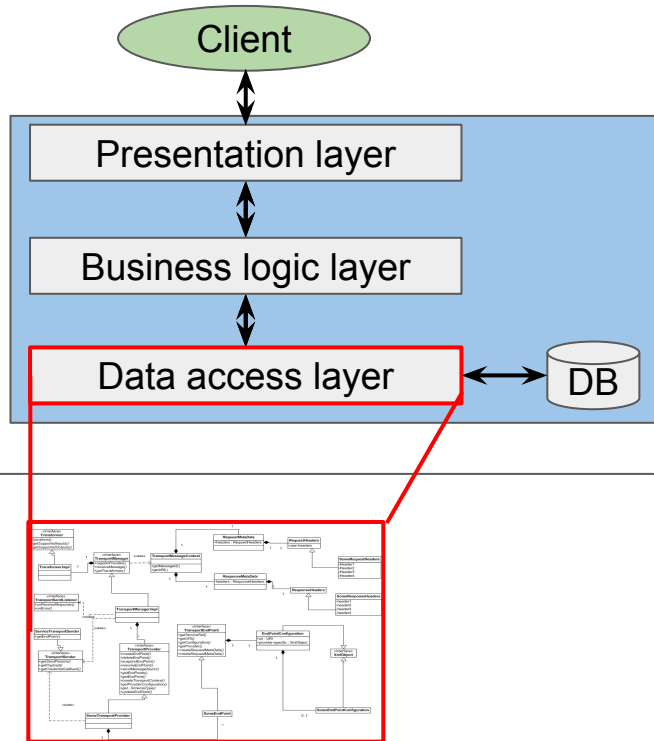

MVC vs. MVP vs. MVVM

MVC vs. MVP vs. MVVM

Software architecture vs. design: summary

Architecture and design

- Components and interfaces: understand, communicate, reuse
- Manage complexity: modularity and separation of concerns
- Process: allow effort estimation and progress monitoring

Additional material, not discussed in class

UML crash course

UML crash course

The main questions

- What is UML?
- Is it useful, why bother?
- When to (not) use UML?

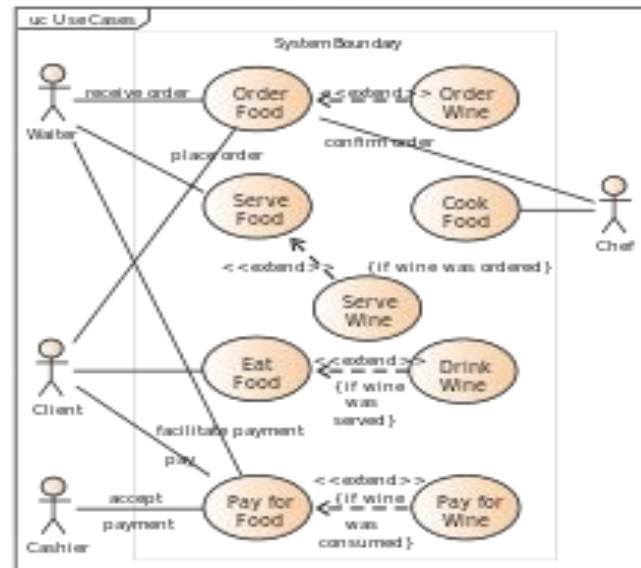

What is UML?

- Unified Modeling Language.
- Developed in the mid 90's, improved since.
- Standardized notation for modeling OO systems.
- A collection of diagrams for different viewpoints:
 - Use case diagrams
 - Component diagrams
 - Class and Object diagrams
 - Sequence diagrams
 - Statechart diagrams
 - ...

What is UML?

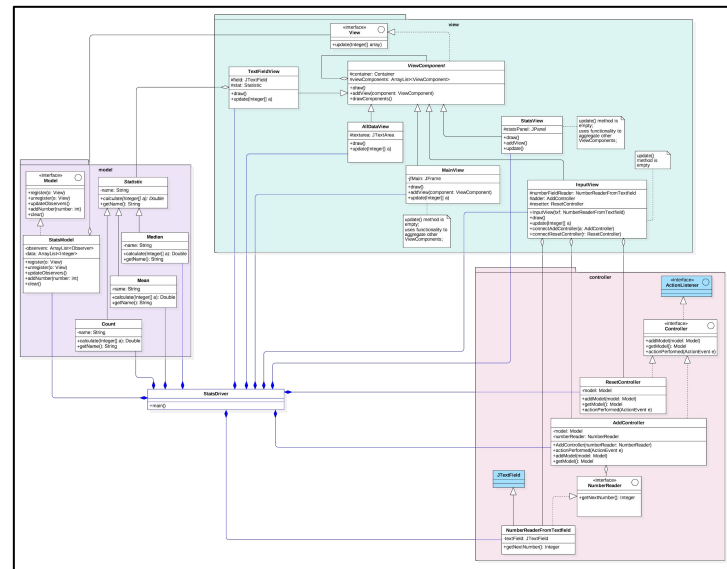

- Unified Modeling Language.
- Developed in the mid 90's, improved since.
- Standardized notation for modeling OO systems.
- A collection of diagrams for different viewpoints:

- **Use case diagrams**
- Component diagrams
- Class and Object diagrams
- Sequence diagrams
- Statechart diagrams
- ...

What is UML?

- Unified Modeling Language.
- Developed in the mid 90's, improved since.
- Standardized notation for modeling OO systems.
- A collection of diagrams for different viewpoints:
 - Use case diagrams
 - Component diagrams
 - **Class and Object diagrams**
 - Sequence diagrams
 - Statechart diagrams
 - ...

The diagram illustrates the interactions between various actors and the system's use cases. The actors are: Waiter, Client, Cashier, and Chef. The use cases are: Order Food, Order Wine, Serve Food, Cook Food, Serve Wine, Eat Food, Drink Wine, Pay for Food, and Pay for Wine. The relationships are as follows:

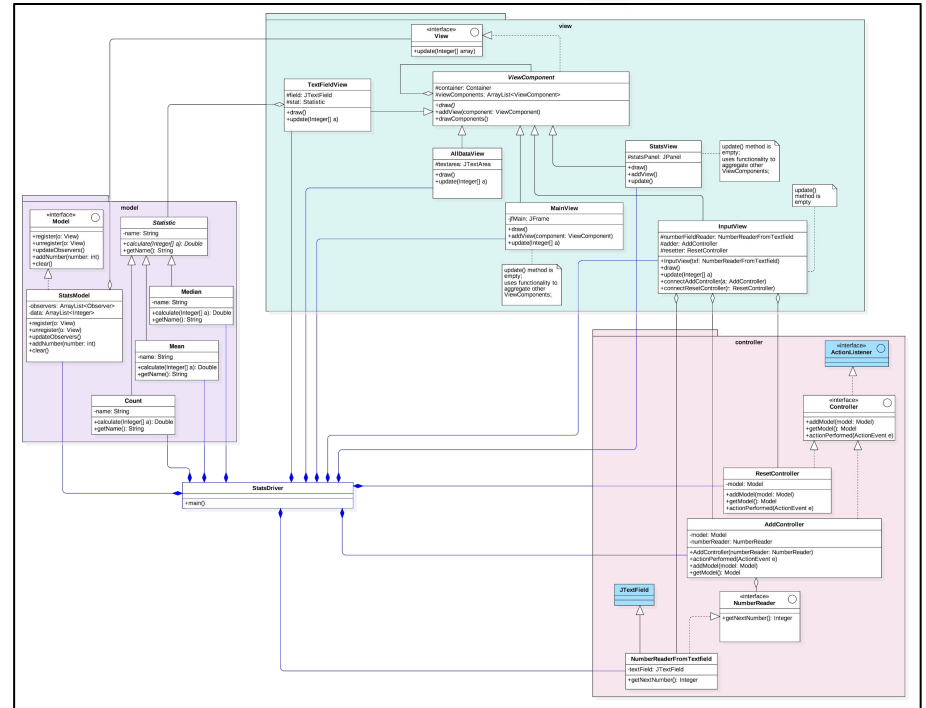

- Waiter** interacts with **Order Food** (receives order), **Order Wine** (receives order), **Serve Food** (place order), and **Pay for Food** (pay).
- Client** interacts with **Order Food** (place order), **Eat Food** (facilitate payment), and **Pay for Food** (accept payment).
- Cashier** interacts with **Pay for Food** (accept payment).
- Chef** interacts with **Order Wine** (confirm order) and **Cook Food**.
- Order Food** leads to **Serve Food**, which leads to **Eat Food**, which leads to **Pay for Food**.
- Order Wine** leads to **Order Wine** (confirm order), which leads to **Cook Food**, which leads to **Serve Wine**.
- Eat Food** leads to **Pay for Food**, which leads to **Pay for Food** (accept payment).
- Serve Wine** leads to **Drink Wine**, which leads to **Pay for Wine**.
- Pay for Food** leads to **Pay for Food** (accept payment).
- Pay for Wine** leads to **Pay for Wine** (accept payment).

    UC9 --> UC9_accept[accept payment]

```

Are UML diagrams useful?

Communication

- Forward design (before coding)
 - Brainstorm ideas (on whiteboard or paper).
 - Draft and iterate over software design.

Documentation

- Backward design (after coding)
 - Obtain diagram from source code.

In this class, we will use UML class diagrams mainly for visualization and discussion purposes.

Classes vs. objects

Class

- Grouping of similar objects.
 - Student
 - Car
- Abstraction of common properties and behavior.
 - Student: Name and Student ID
 - Car: Make and Model

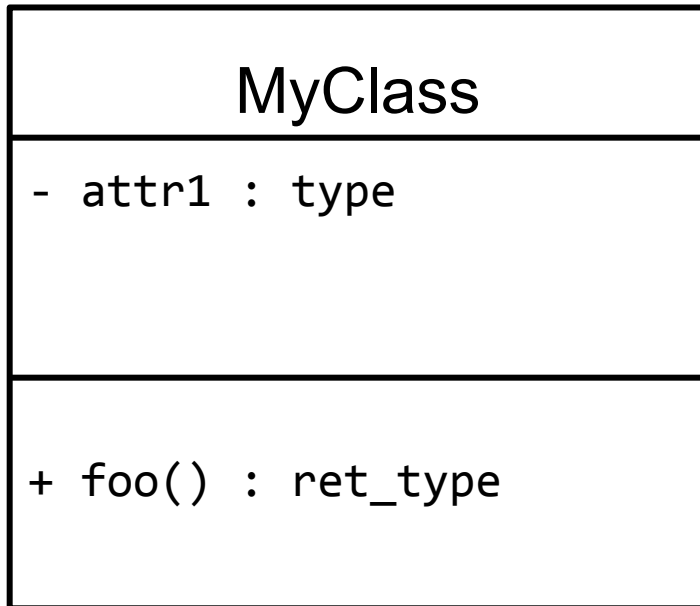

Object

- Entity from the real world.
- Instance of a class
 - Student: Joe (4711), Jane (4712), ...
 - Car: Audi A6, Honda Civic, ...

UML class diagram: basic notation

UML class diagram: concrete example

```
public class Person {  
    ...  
}
```

Person

```
public class Student  
    extends Person {  
-----  
    private int id;  
-----  
    public Student(String name,  
                    int id) {  
        ...  
    }  
  
    public int getId() {  
        return this.id;  
    }  
}
```

Student

- id : int

+ **Student**(name:String, id:int)
+ **getId**() : int

Classes, abstract classes, and interfaces

MyClass

MyAbstractClass

{abstract}

<<interface>>

MyInterface

Classes, abstract classes, and interfaces

MyClass

MyAbstractClass

{abstract}

<<interface>>

MyInterface

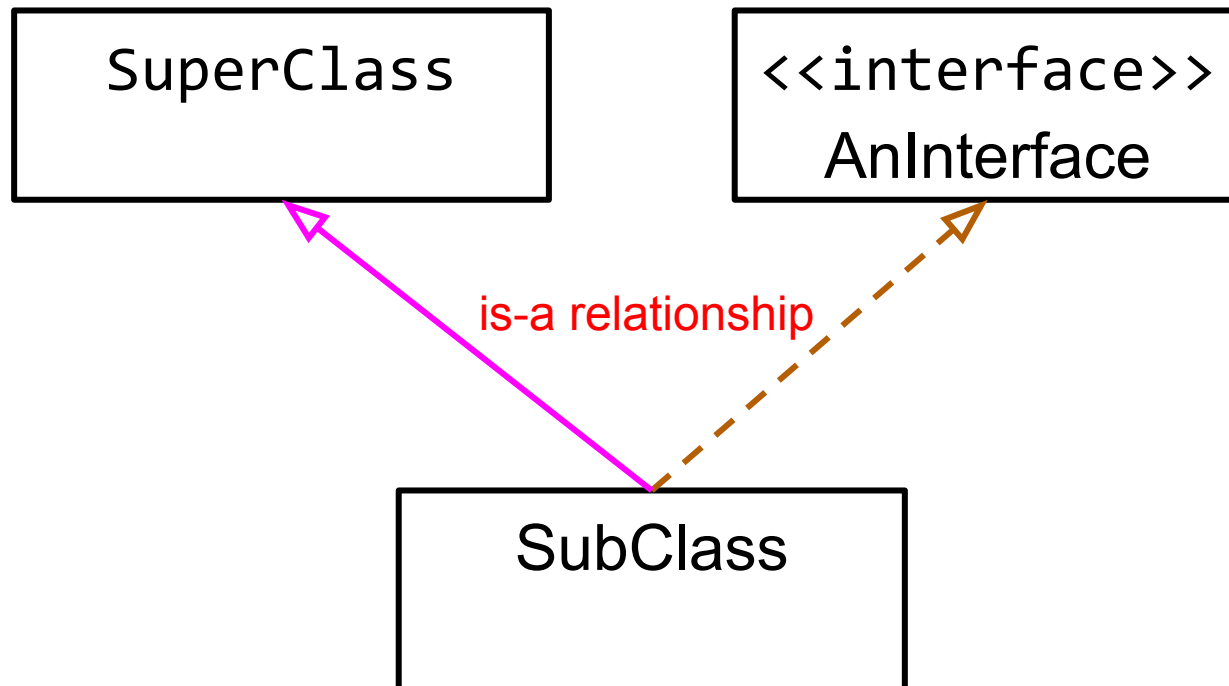

```
public class MyClass {  
  
    public void op() {  
        ...  
    }  
  
    public int op2() {  
        ...  
    }  
}
```

```
public abstract class  
    MyAbstractClass {  
  
    public abstract void op();  
  
    public int op2() {  
        ...  
    }  
}
```

```
public interface  
    MyInterface {  
  
    public void op();  
  
    public int op2();  
}
```

Level of detail in a given class or interface may vary and depends on context and purpose.

UML class diagram: Inheritance

```
public class SubClass extends SuperClass implements AnInterface
```

UML class diagram: Aggregation and Composition

Aggregation

- Existence of Part does not depend on the existence of Whole.
- Lifetime of Part does not depend on Whole.
- No single instance of whole is the unique owner of Part (might be shared with other instances of Whole).

Composition

- Part cannot exist without Whole.
- Lifetime of Part depends on Whole.
- One instance of Whole is the single owner of Part.

Aggregation or Composition?

Aggregation or Composition?

What about class and students or body and body parts?

UML class diagram: multiplicity

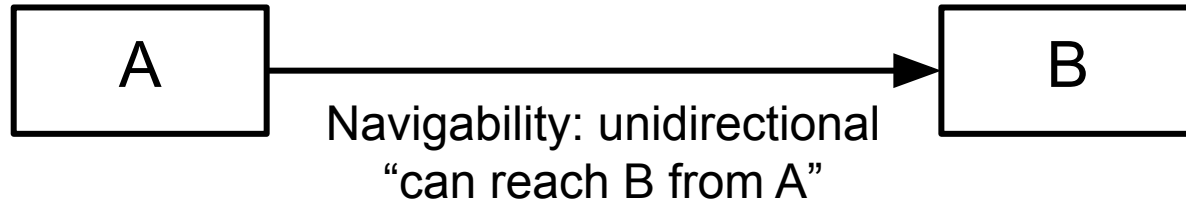

Each A is associated with exactly one B
Each B is associated with exactly one A

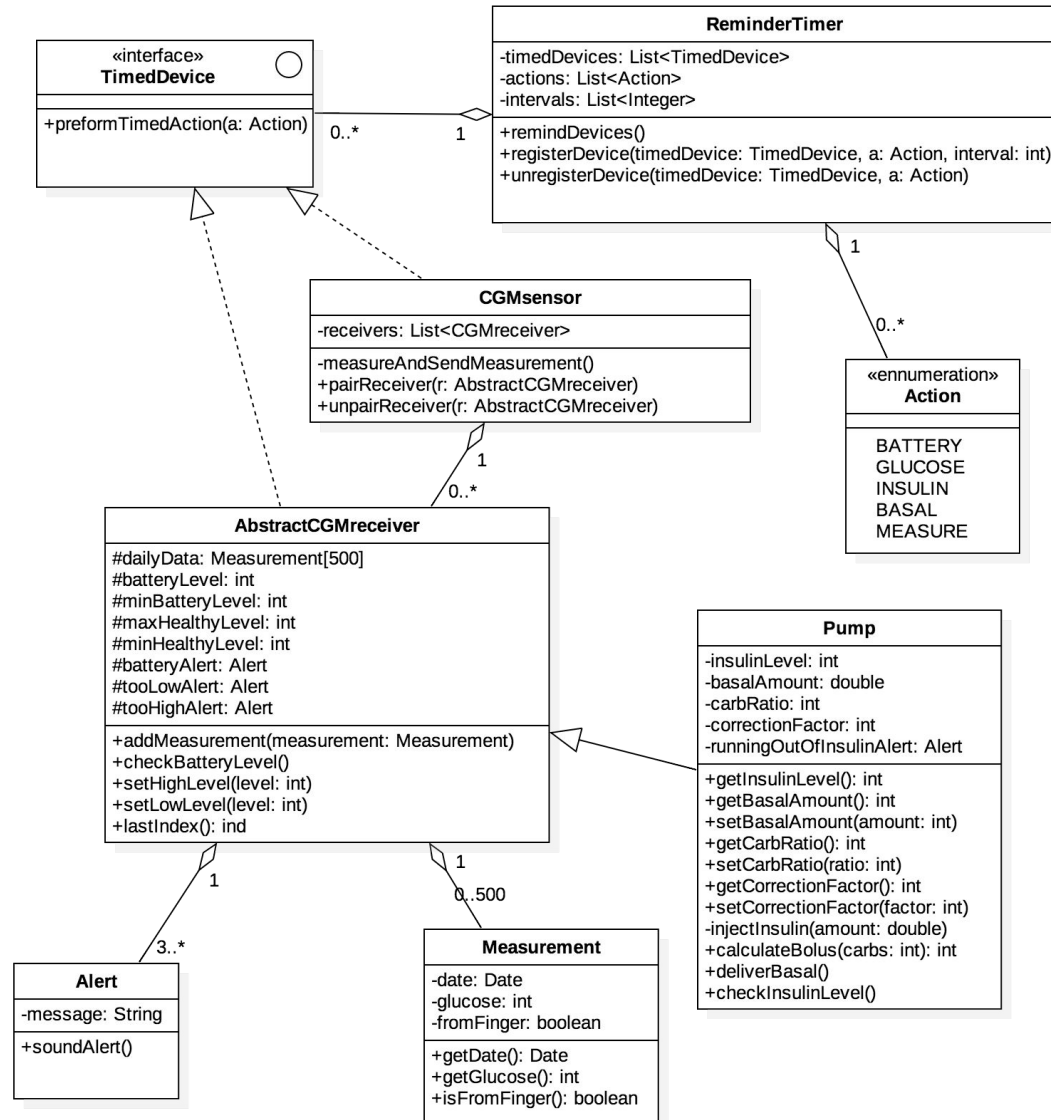

Each A is associated with any number of Bs
Each B is associated with exactly one or two As

UML class diagram: navigability

UML class diagram: example

Summary: UML

- Unified notation for modeling OO systems.
- Allows different levels of abstraction.
- Suitable for design discussions and documentation.

OO design principles

OO design principles

- **Information hiding (and encapsulation)**
- Polymorphism
- Open/closed principle
- Inheritance in Java
- The diamond of death
- Liskov substitution principle
- Composition/aggregation over inheritance

Information hiding

MyClass
+ nElem : int + capacity : int + top : int + elems : int[] + canResize : bool
+ resize(s:int):void + push(e:int):void + capacityLeft():int + getNumElem():int + pop():int + getElems():int[]

```
public class MyClass {  
    public int nElem;  
    public int capacity;  
    public int top;  
    public int[] elems;  
    public boolean canResize;  
    ...  
    public void resize(int s){...}  
    public void push(int e){...}  
    public int capacityLeft(){...}  
    public int getNumElem(){...}  
    public int pop(){...}  
    public int[] getElems(){...}  
}
```

Information hiding

MyClass
+ nElem : int + capacity : int + top : int + elems : int[] + canResize : bool
+ resize(s:int):void + push(e:int):void + capacityLeft():int + getNumElem():int + pop():int + getElems():int[]

```
public class MyClass {  
    public int nElem;  
    public int capacity;  
    public int top;  
    public int[] elems;  
    public boolean canResize;  
    ...  
    public void resize(int s){...}  
    public void push(int e){...}  
    public int capacityLeft(){...}  
    public int getNumElem(){...}  
    public int pop(){...}  
    public int[] getElems(){...}  
}
```

What does MyClass do?

Information hiding

Stack
+ nElem : int + capacity : int + top : int + elems : int[] + canResize : bool
+ resize(s:int):void + push(e:int):void + capacityLeft():int + getNumElem():int + pop():int + getElems():int[]

```
public class Stack {  
    public int nElem;  
    public int capacity;  
    public int top;  
    public int[] elems;  
    public boolean canResize;  
  
    ...  
  
    public void resize(int s){...}  
    public void push(int e){...}  
    public int capacityLeft(){...}  
    public int getNumElem(){...}  
    public int pop(){...}  
    public int[] getElems(){...}  
}
```

Anything that could be improved in this implementation?

Information hiding

Stack
+ nElem : int + capacity : int + top : int + elems : int[] + canResize : bool
+ resize(s:int):void + push(e:int):void + capacityLeft():int + getNumElem():int + pop():int + getElems():int[]

Stack
- elems : int[] ...
+ push(e:int):void + pop():int ...

Information hiding:

- Reveal as little information about internals as possible.
- Segregate public interface and implementation details.
- Reduces complexity.

Information hiding vs. visibility

Information hiding vs. visibility

- Protected, package-private, or friend-accessible (C++).
- Not part of the public API.
- Implementation detail that a subclass/friend may rely on.

OO design principles

- Information hiding (and encapsulation)
- **Polymorphism**
- Open/closed principle
- Inheritance in Java
- The diamond of death
- Liskov substitution principle
- Composition/aggregation over inheritance

A little refresher: what is Polymorphism?

A little refresher: what is Polymorphism?

An object's ability to provide different behaviors.

Types of polymorphism

- Ad-hoc polymorphism (e.g., operator overloading)
 - `a + b` ⇒ String vs. int, double, etc.
- Subtype polymorphism (e.g., method overriding)
 - `Object obj = ...;` ⇒ `toString()` can be overridden in subclasses
`obj.toString();` and therefore provide a different behavior.
- Parametric polymorphism (e.g., Java generics)
 - `class LinkedList<E> {` ⇒ A LinkedList can store elements
`void add(E) {...` regardless of their type but still
`E get(int index) {...}` provide full type safety.

A little refresher: what is Polymorphism?

An object's ability to provide different behaviors.

Types of polymorphism

- Subtype polymorphism (e.g., method overriding)
 - `Object obj = ...;` \Rightarrow `toString()` can be overridden in subclasses and therefore provide a different behavior.
`obj.toString();`

Subtype polymorphism is essential to many OO design principles.

OO design principles

- Information hiding (and encapsulation)
- Polymorphism
- **Open/closed principle**
- Inheritance in Java
- The diamond of death
- Liskov substitution principle
- Composition/aggregation over inheritance

Open/closed principle

Software entities (classes, components, etc.) should be:

- **open** for extensions
- **closed** for modifications

```
public static void draw(Object o) {  
    if (o instanceof Square) {  
        drawSquare((Square) o)  
    } else if (o instanceof Circle) {  
        drawCircle((Circle) o);  
    } else {  
        ...  
    }  
}
```

Good or bad design?

Open/closed principle

Software entities (classes, components, etc.) should be:

- **open** for extensions
- **closed** for modifications

```
public static void draw(Object o) {  
    if (o instanceof Square) {  
        drawSquare((Square) o)  
    } else if (o instanceof Circle) {  
        drawCircle((Circle) o);  
    } else {  
        ...  
    }  
}
```

Violates the open/closed
principle!

Open/closed principle

Software entities (classes, components, etc.) should be:

- **open** for extensions
- **closed** for modifications

```
public static void draw(Object s) {  
    if (s instanceof Shape) {  
        s.draw();  
    } else {  
        ...  
    }  
}
```

```
public static void draw(Shape s) {  
    s.draw();  
}
```

OO design principles

- Information hiding (and encapsulation)
- Polymorphism
- Open/closed principle
- **Inheritance in Java**
- The diamond of death
- Liskov substitution principle
- Composition/aggregation over inheritance

Inheritance: (abstract) classes and interfaces

SequentialList
{abstract}

LinkedList

Inheritance: (abstract) classes and interfaces

OO design principles

- Information hiding (and encapsulation)
- Polymorphism
- Open/closed principle
- Inheritance in Java
- **The diamond of death**
- Liskov substitution principle
- Composition/aggregation over inheritance

The “diamond of death”: the problem

```
...  
A a = new D();  
int num = a.getNum();  
...
```

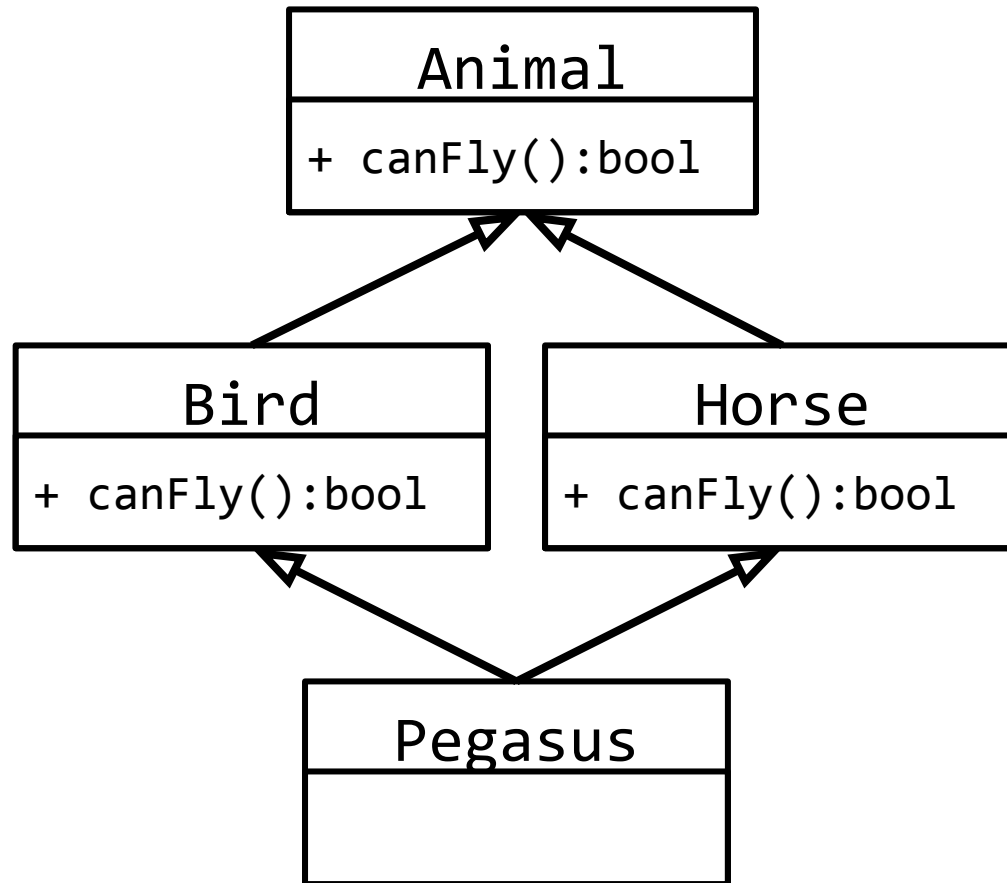

The “diamond of death”: the problem

```
...  
A a = new D();  
int num = a.getNum();  
...
```

Which `getNum()` method
should be called?

The “diamond of death”: concrete example

Can this happen in Java? Yes, with default methods in Java 8.

OO design principles

- Information hiding (and encapsulation)
- Polymorphism
- Open/closed principle
- Inheritance in Java
- The diamond of death
- **Liskov substitution principle**
- Composition/aggregation over inheritance

Design principles: Liskov substitution principle

Motivating example

We know that a square is a special kind of a rectangle. So, which of the following OO designs makes sense?

Design principles: Liskov substitution principle

Subtype requirement

Let object x be of type $T1$ and object y be of type $T2$. Further, let $T2$ be a subtype of $T1$ ($T2 \leq T1$). Any provable property about objects of type $T1$ should be true for objects of type $T2$.

Is the subtype requirement fulfilled?

Design principles: Liskov substitution principle

Subtype requirement

Let object x be of type $T1$ and object y be of type $T2$. Further, let $T2$ be a subtype of $T1$ ($T2 \leq T1$). Any provable property about objects of type $T1$ should be true for objects of type $T2$.

```
Rectangle r =  
    new Rectangle(2,2);
```

```
int A = r.getArea();  
int w = r.getWidth();  
r.setWidth(w * 2);
```

```
assertEquals(A * 2,  
    r.getArea());
```

Design principles: Liskov substitution principle

Subtype requirement

Let object x be of type $T1$ and object y be of type $T2$. Further, let $T2$ be a subtype of $T1$ ($T2 \leq T1$). Any provable property about objects of type $T1$ should be true for objects of type $T2$.

```
Rectangle r =  
new Rectangle(2,2);  
new Square(2);  
  
int A = r.getArea();  
int w = r.getWidth();  
r.setWidth(w * 2);  
  
assertEquals(A * 2,  
    r.getArea());
```

Design principles: Liskov substitution principle

Subtype requirement

OO design principles

- Information hiding (and encapsulation)
- Polymorphism
- Open/closed principle
- Inheritance in Java
- The diamond of death
- Liskov substitution principle
- **Composition/aggregation over inheritance**

Inheritance vs. (Aggregation vs. Composition)

```
public class Student
    extends Person{
    public Student(){
    }
    ...
}
```

is-a relationship

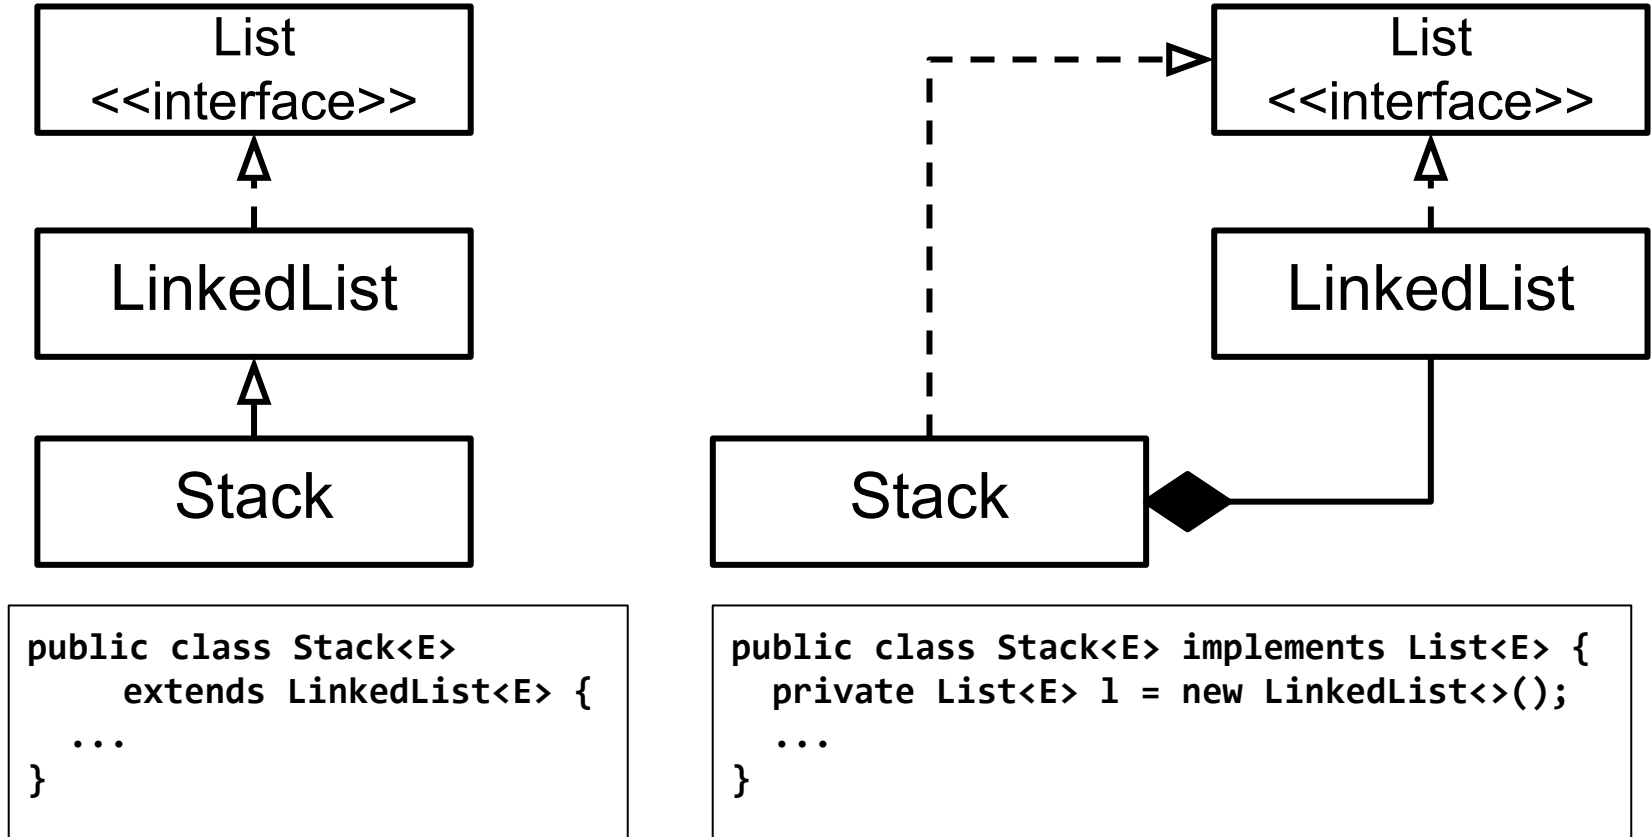

```
public class Bank {
    Customer c;
    public Bank(Customer c){
        this.c = c;
    }
    ...
}
```

```
public class Building {
    Room r;
    public Building(){
        this.r = new Room();
    }
    ...
}
```

has-a relationship

Design choice: inheritance or composition?

Hmm, both designs seem valid -- what are pros and cons?

Design choice: inheritance or composition?

Pros

- No delegation methods required.
- Reuse of common state and behavior.

Cons

- Exposure of all inherited methods (a client might rely on this particular superclass -> can't change it later).
- Changes in superclass are likely to break subclasses.

Pros

- Highly flexible and configurable: no additional subclasses required for different compositions.

Cons

- All interface methods need to be implemented -> delegation methods required, even for code reuse.

Composition/aggregation over inheritance allows more flexibility.

OO design principles: summary

- Information hiding (and encapsulation)
- Open/closed principle
- Liskov substitution principle
- Composition/aggregation over inheritance

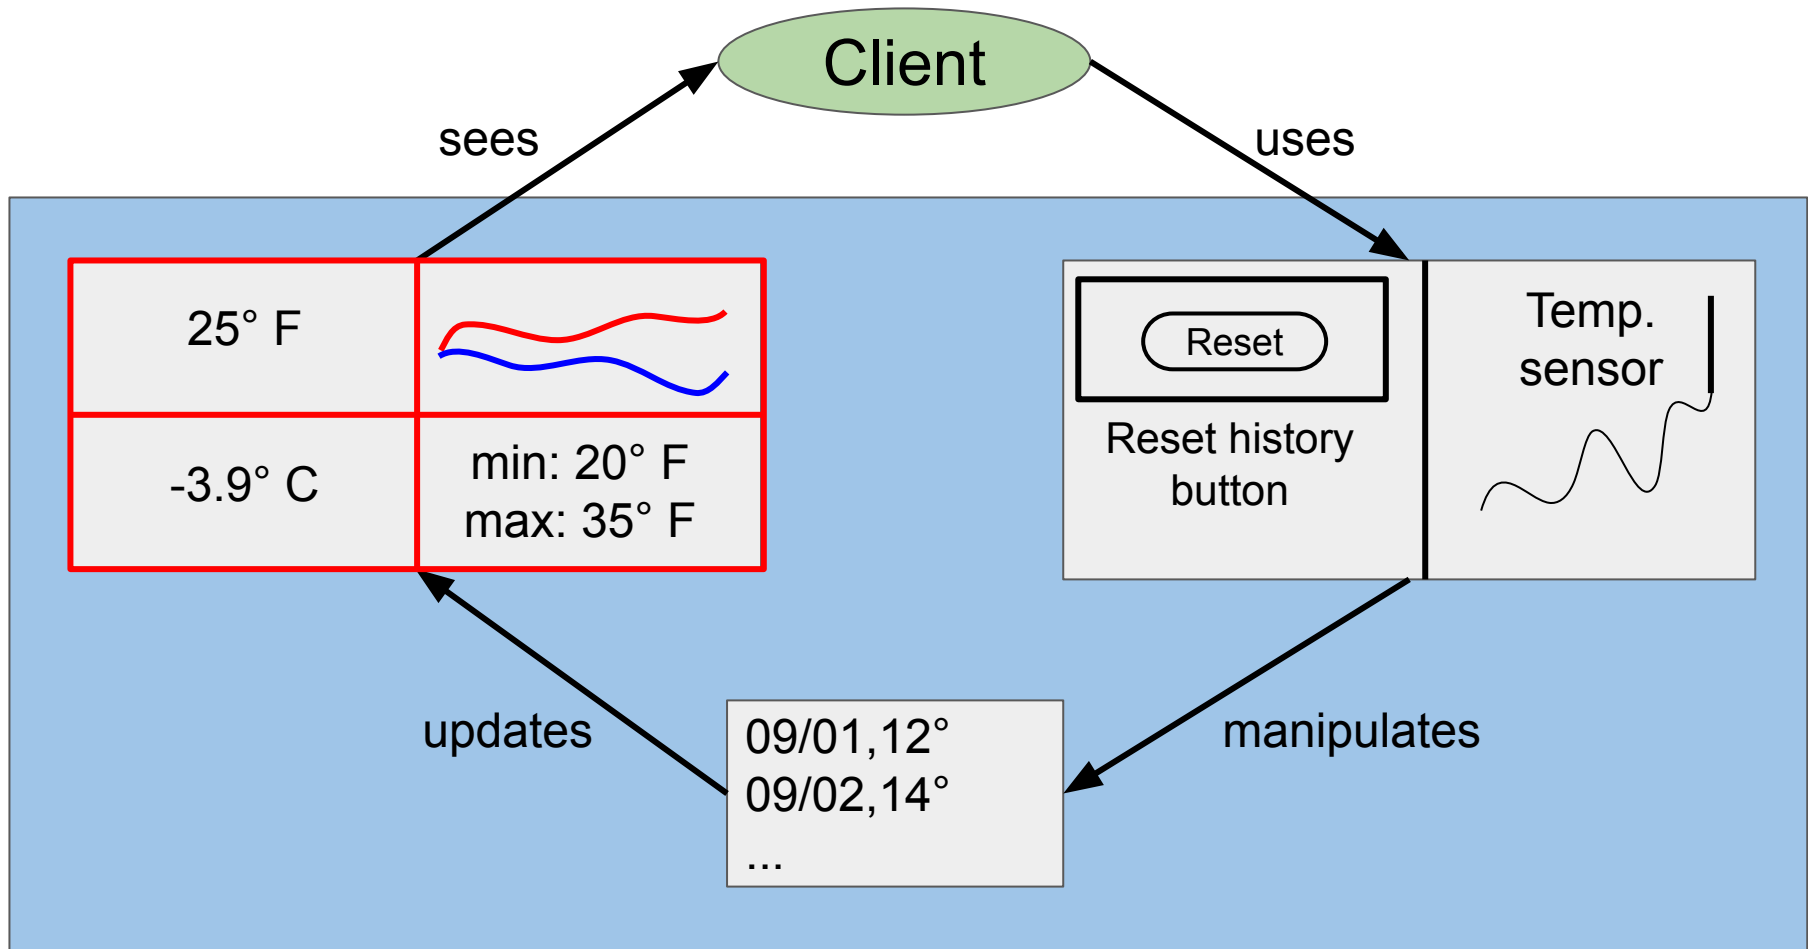

OO design patterns

A first design problem

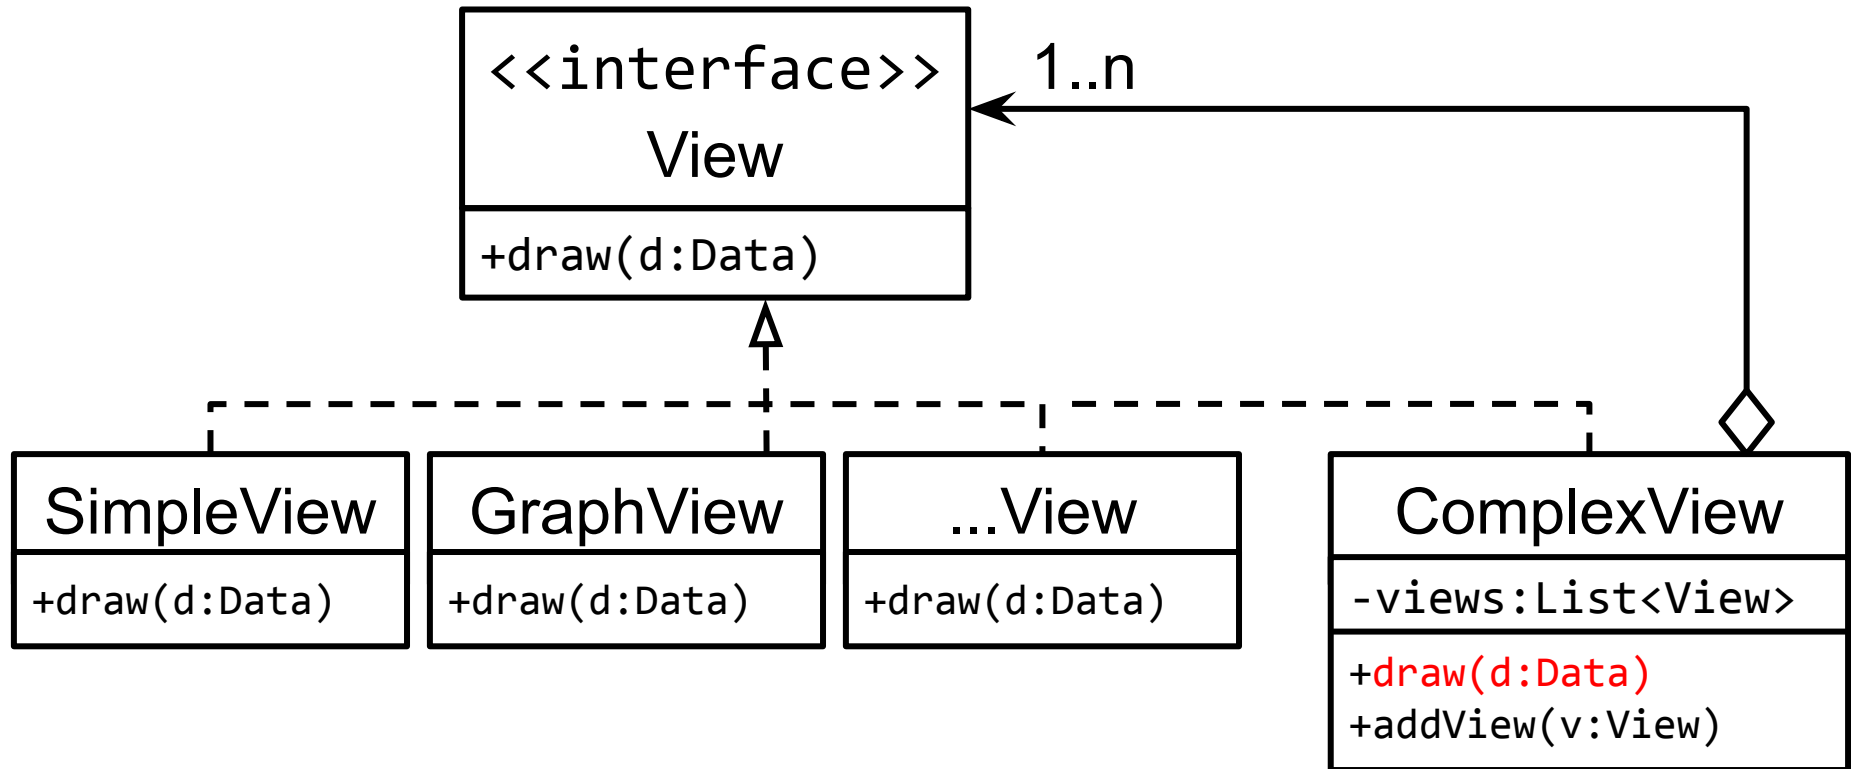

Weather station revisited

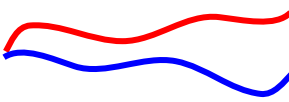

What's a good design for the view component?

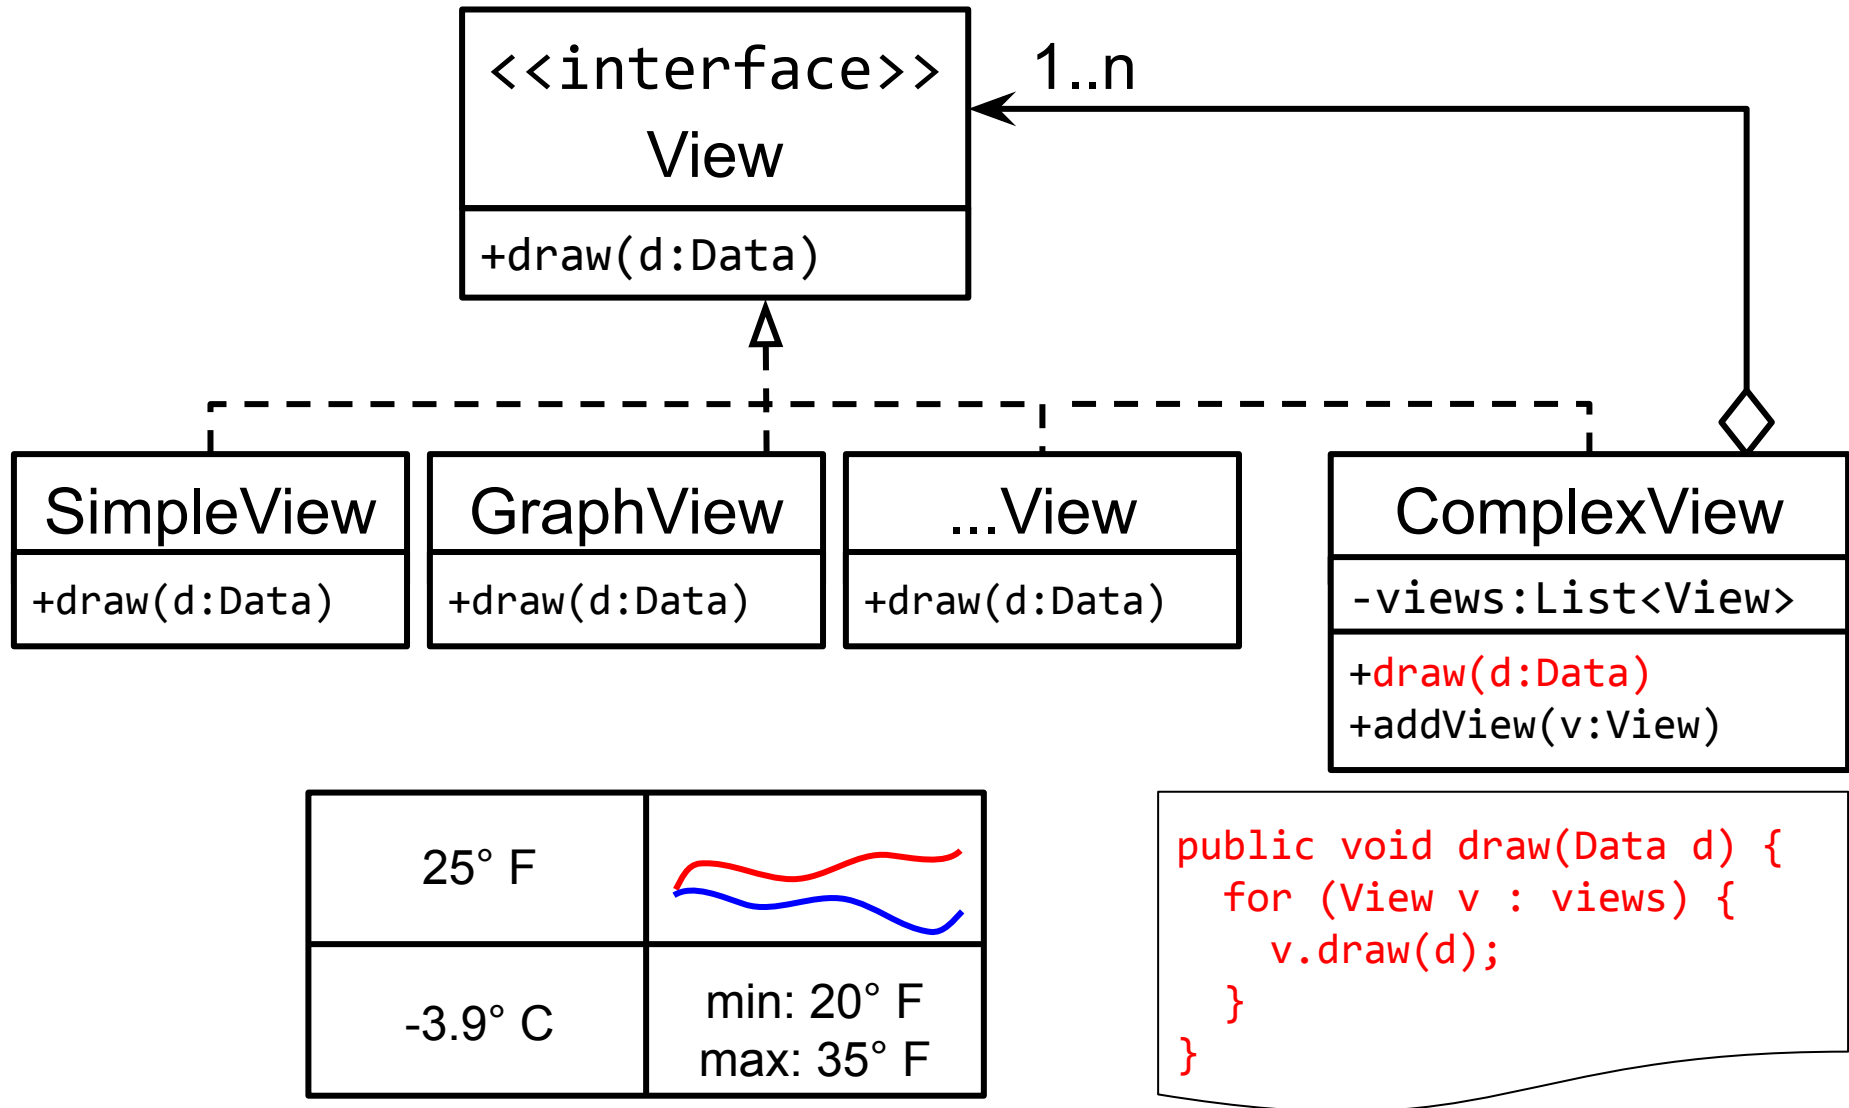

Weather station: view

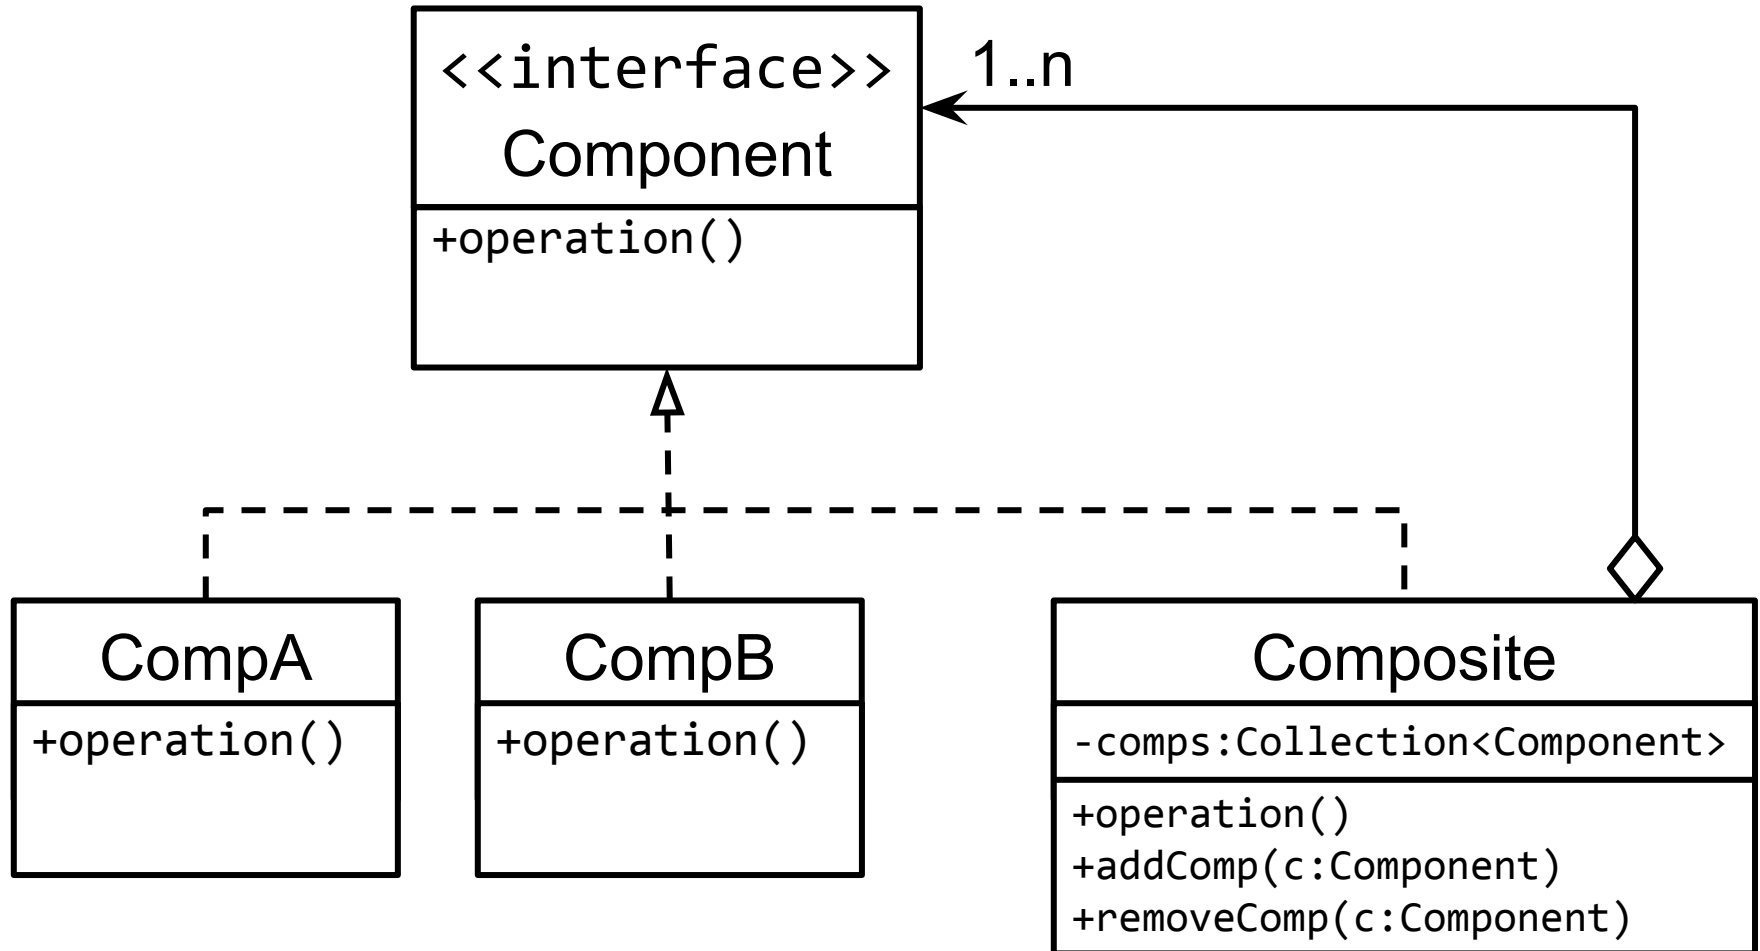

25° F	
-3.9° C	min: 20° F max: 35° F

How do we need to
implement
`draw(d:Data)`?

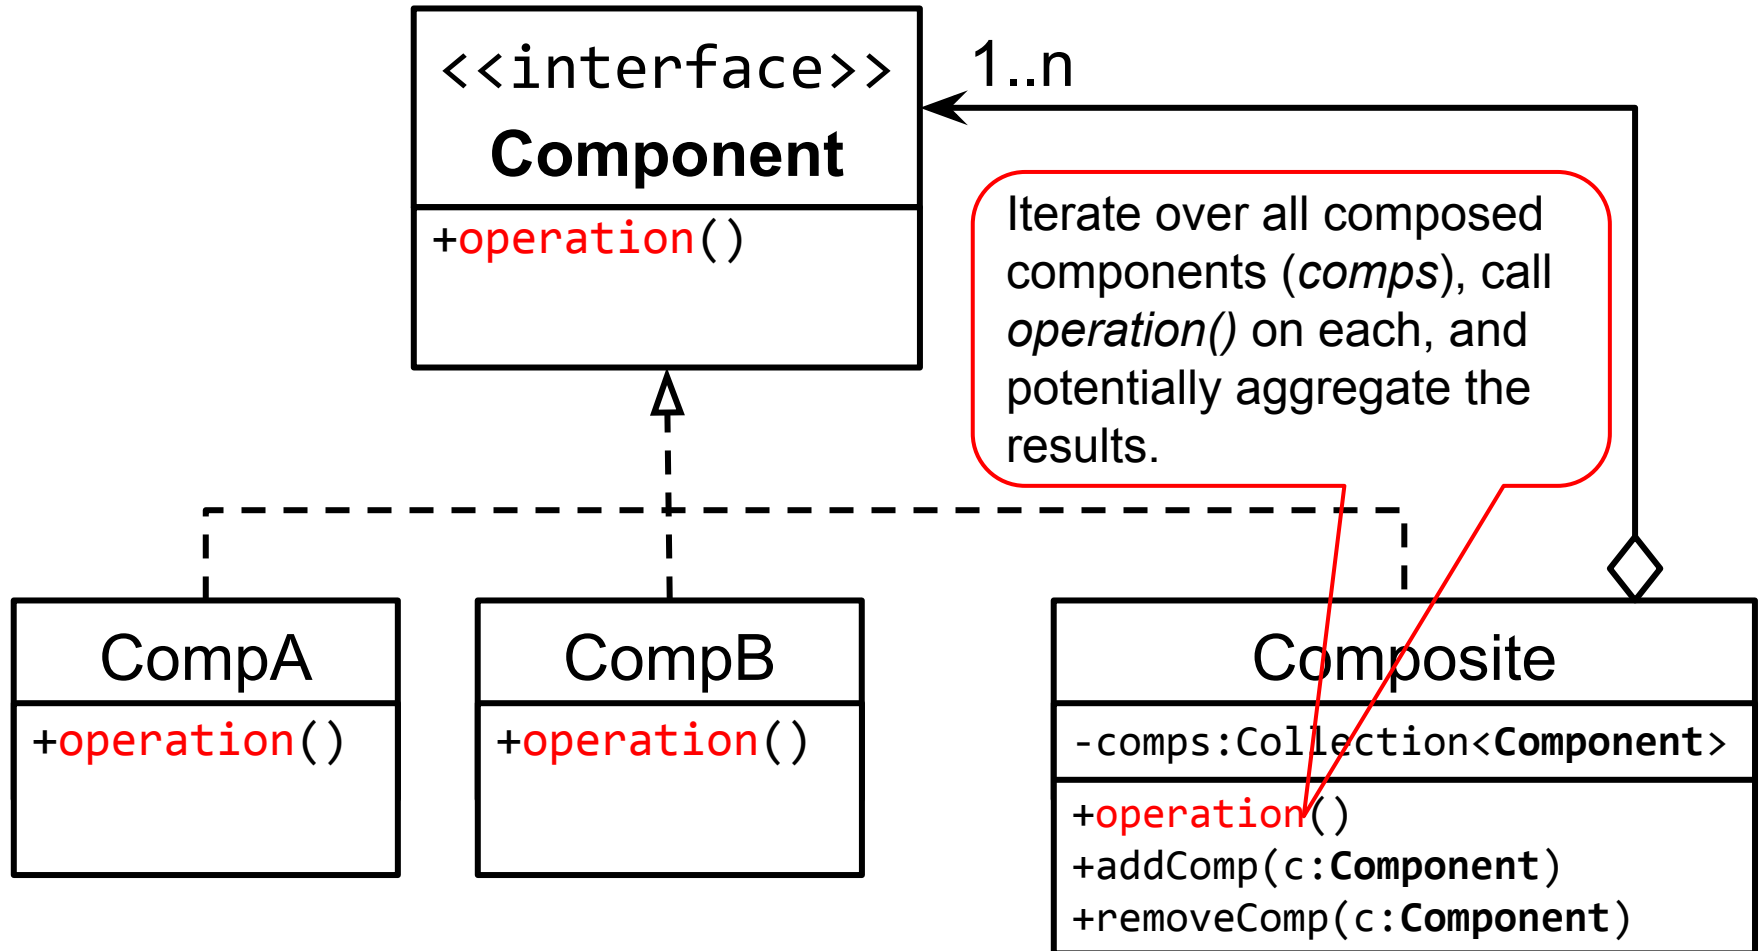

Weather station: view

The general solution: Composite pattern

The general solution: Composite pattern

What is a design pattern?

- Addresses a recurring, common design problem.
- Provides a generalizable solution.
- Provides a common terminology.

What is a design pattern?

- Addresses a recurring, common design problem.
- Provides a generalizable solution.
- Provides a common terminology.

Pros

- Improves communication and documentation.
- “Toolbox” for novice developers.

Cons

- Risk of over-engineering.
- Potential impact on system performance.

More than just a name for common sense and best practices.

Design patterns: categories

1. Structural

- Composite
- Decorator
- ...

2. Behavioral

- Template method
- Visitor
- ...

3. Creational

- Singleton
- Factory (method)
- ...

Design patterns: categories

1. Structural

- Composite
- Decorator
- ...

2. Behavioral

- Template method
- Visitor
- ...

3. Creational

- Singleton
- Factory (method)
- ...

Another design problem: I/O streams

```
...
InputStream is =
    new FileInputStream(...);

int b;
while((b=is.read()) != -1) {
    // do something
}
...
```

Another design problem: I/O streams

```
...
InputStream is =
    new FileInputStream(...);

int b;
while((b=is.read()) != -1) {
    // do something
}
...
```

Problem: filesystem I/O is expensive

Another design problem: I/O streams

```
...
InputStream is =
    new FileInputStream(...);

int b;
while((b=is.read()) != -1) {
    // do something
}
...
```

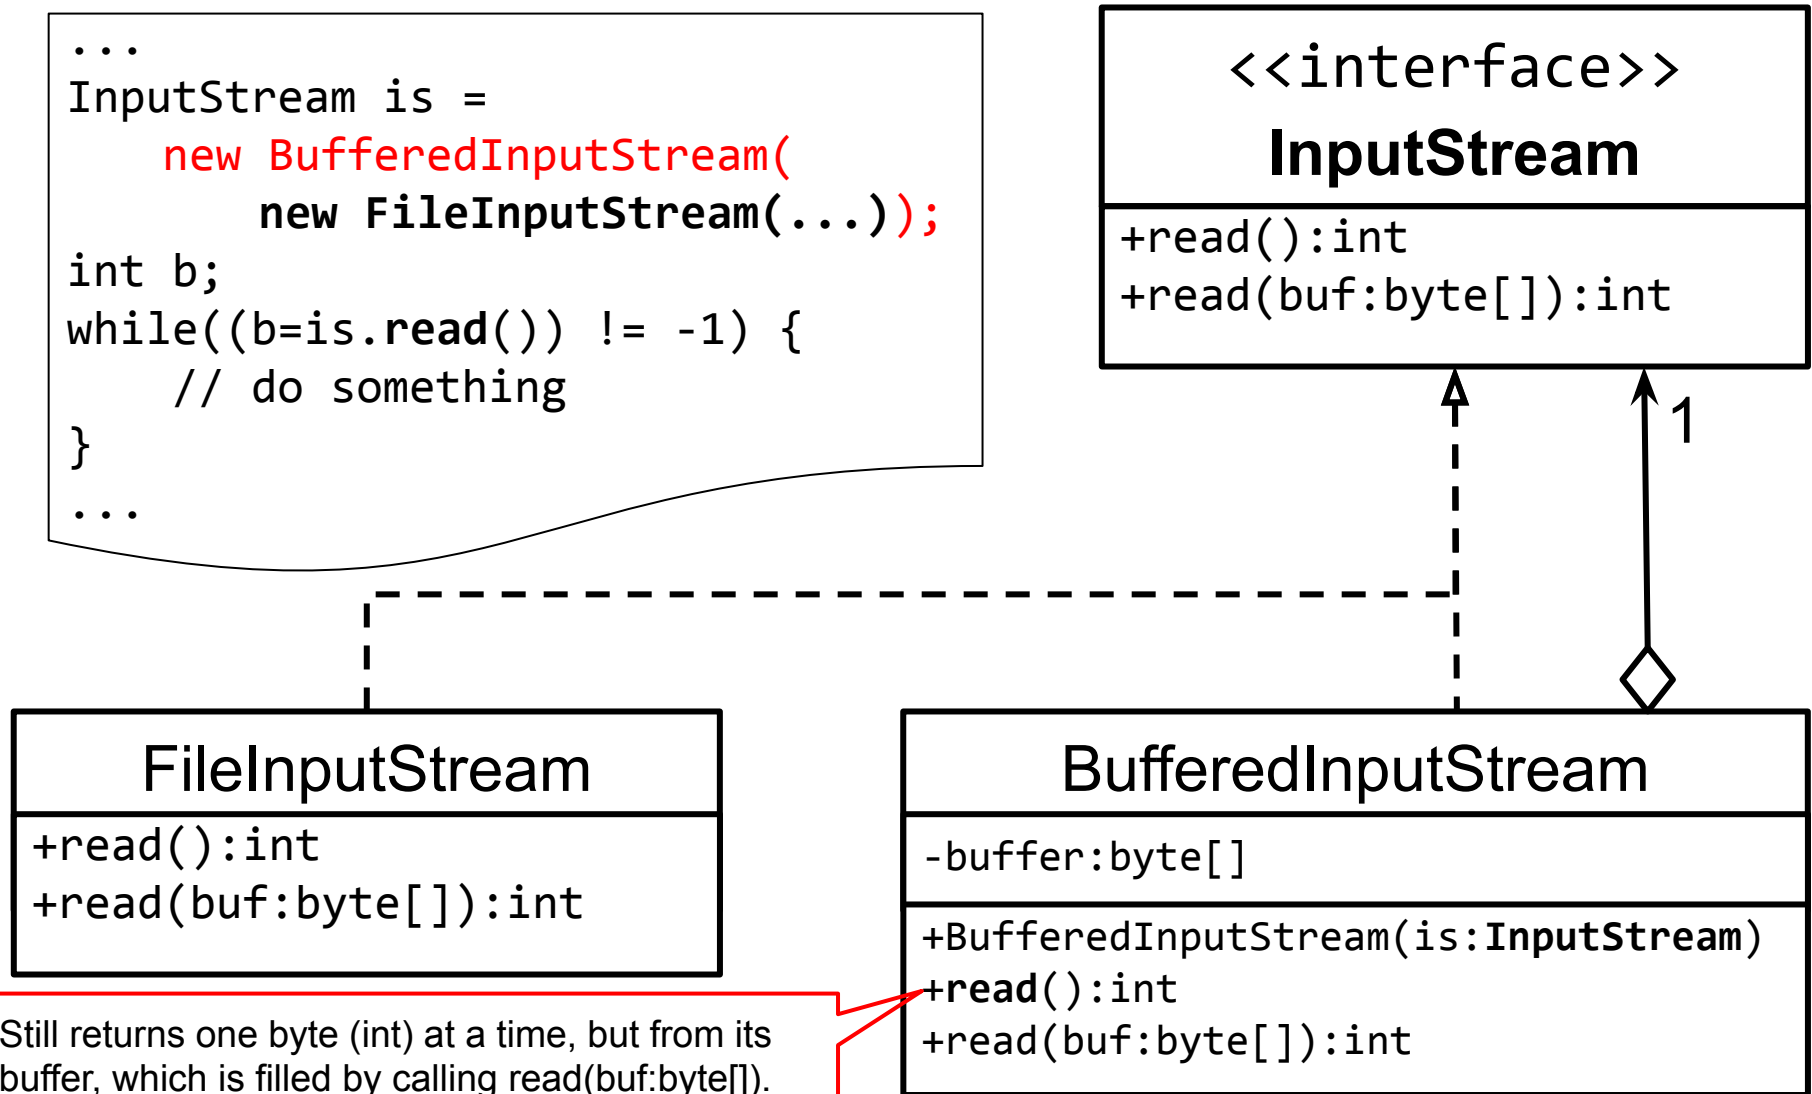

Problem: filesystem I/O is expensive
Solution: use a buffer!

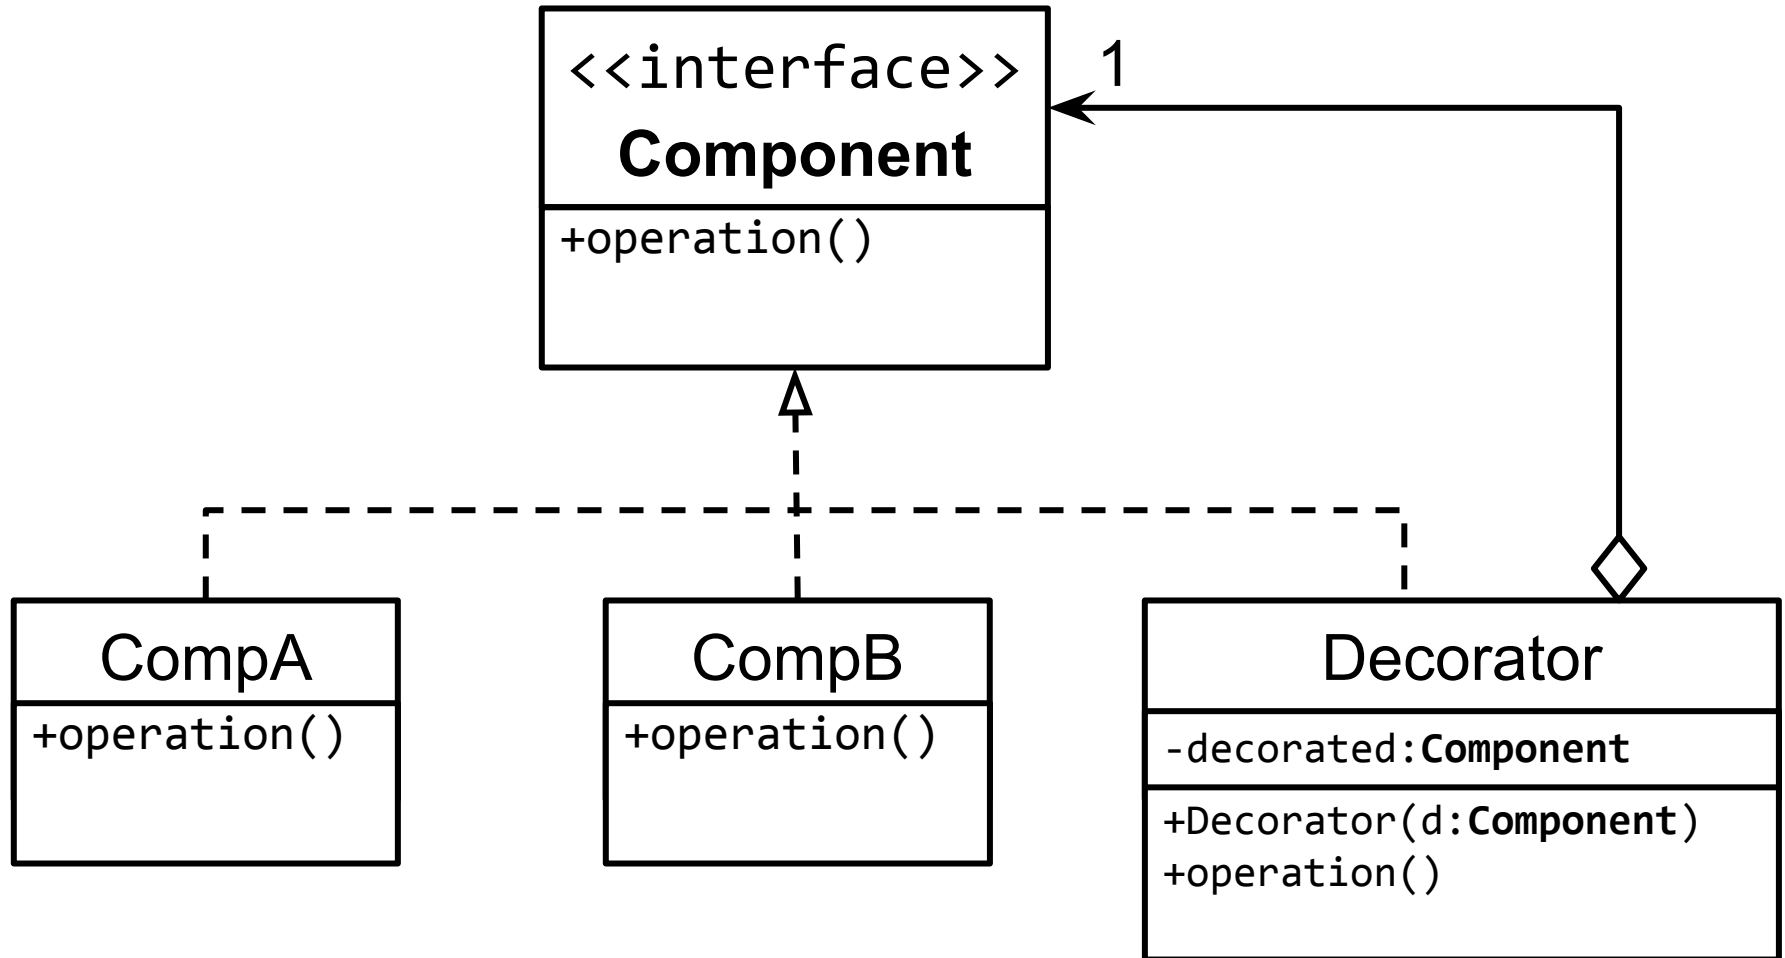

Why not simply implement the
buffering in the client or subclass?

Another design problem: I/O streams

```
...
InputStream is =
    new BufferedInputStream(
        new FileInputStream(...));
int b;
while((b=is.read()) != -1) {
    // do something
}
...
```

The general solution: Decorator pattern

Composite vs. Decorator
